# MIXED POLYNOMIAL/POWER SERIES RINGS AND RELATIONS AMONG THEIR SPECTRA 

William Heinzer<br>joint with Christel Rotthaus and Sylvia Wiegand<br>Department of Mathematics<br>Purdue University

## OVERVIEW 1

At first glance the rings

$$
B:=k[[y]][x] \quad \text { and } \quad C:=k[x][[y]]
$$

look similar. One has

## OVERVIEW 1

At first glance the rings

$$
B:=k[[y]][x] \quad \text { and } \quad C:=k[x][[y]]
$$

look similar. One has

$$
B=k[[y]][x] \hookrightarrow k[x][[y]]=C,
$$

but this is a strict inclusion.

## OVERVIEW 1

At first glance the rings

$$
B:=k[[y]][x] \quad \text { and } \quad C:=k[x][[y]]
$$

look similar. One has

$$
B=k[[y]][x] \hookrightarrow k[x][[y]]=C,
$$

but this is a strict inclusion.
For example, $1-x y$ is a nonunit of $B$, and

$$
\frac{1}{1-x y}=\sum_{i=0}^{\infty} x^{n} y^{n} \in C
$$

2005 Fall Central Section Meeting, Lincoln, Nebraska, October 2005 - p. $2 / 2$
So $1-x y$ is a unit of $C$.

## CONCLUSION

Indeed, the rings $B=k[[y]][x]$ and $C=k[x][[y]]$ are not isomorphic: the intersection of the maximal ideals
of $B$ is (0), while $y$ is in every maximal ideal of $C$.

## Overview 2

Consider the mixed polynomial/power series rings

$$
k[x, y] \hookrightarrow k[[y]][x] \hookrightarrow k[x][[y]] \hookrightarrow k[[x, y]],
$$

where $k$ is a field. The inclusion maps here are all flat homomorphisms. The prime ideal structure of these rings is well understood. The above inclusions induce maps

## Overview 2

Consider the mixed polynomial/power series rings

$$
k[x, y] \hookrightarrow k[[y]][x] \hookrightarrow k[x][[y]] \hookrightarrow k[[x, y]],
$$

where $k$ is a field. The inclusion maps here are all flat homomorphisms. The prime ideal structure of these rings is well understood. The above inclusions induce maps

$$
\operatorname{Spec} A \leftarrow \operatorname{Spec} B \quad \leftarrow \operatorname{Spec} C \quad \leftarrow \operatorname{Spec} D
$$

We are interested in describing these Spec maps.

## Overview 3

## Consider

$$
k[x][[y]]=C \hookrightarrow C[1 / x] \hookrightarrow k[x, 1 / x][[y]]:=E,
$$

## Overview 3

## Consider

$$
k[x][[y]]=C \hookrightarrow C[1 / x] \hookrightarrow k[x, 1 / x][[y]]:=E,
$$

At first glance, it appears that $E$ is a localization of $C$, but it is not. There are elements in $E$ that are not in the fraction field of $C$. However, $E$ is obtained from $C$ by the localization $C[1 / x]$ followed by the $(y)$ - adic completion of $C[1 / x]$. Thus $E$ is flat over $C$. The map $C \hookrightarrow E$ induces $\operatorname{Spec} C \leftarrow \operatorname{Spec} E$, and again we are interested in describing this Spec map.

## Overview 4

## Also consider

$$
C_{1}:=k[x]\left[\left[\frac{y}{x}\right]\right] \hookrightarrow \cdots \hookrightarrow C_{n}:=k[x]\left[\left[\frac{y}{x^{n}}\right]\right] \hookrightarrow \cdots \hookrightarrow E .
$$

## Overview 4

## Also consider

$$
C_{1}:=k[x]\left[\left[\frac{y}{x}\right]\right] \hookrightarrow \cdots \hookrightarrow C_{n}:=k[x]\left[\left[\frac{y}{x^{n}}\right]\right] \hookrightarrow \cdots \hookrightarrow E .
$$

The maps $C \hookrightarrow C_{n}$ and $C_{i} \hookrightarrow C_{n}$ for $i<n$ are not flat, but $C_{n} \hookrightarrow E=k[x, 1 / x][[y]]$ is the localization $C_{n}[1 / x]$ followed by the (y)-adic completion of $C_{n}[1 / x]$. Thus $C_{n} \hookrightarrow E$ is flat. These inclusion maps induce maps $\operatorname{Spec} C \leftarrow \operatorname{Spec} C_{1} \leftarrow \cdots \leftarrow \operatorname{Spec} C_{n} \leftarrow \cdots \leftarrow \operatorname{Spec} E$.

We are interested in describing these Spec maps.

## Generic fiber rings

Let $R \hookrightarrow S$ be an injective homomorphism of commutative rings with $R$ an integral domain. DEFINITION. The generic fiber ring of the map $R \hookrightarrow S$ is the localization $(R \backslash\{0\})^{-1} S$ of $S$.

## Generic fiber rings

Let $R \hookrightarrow S$ be an injective homomorphism of commutative rings with $R$ an integral domain.

DEFINITION. The generic fiber ring of the map $R \hookrightarrow S$ is the localization $(R \backslash\{0\})^{-1} S$ of $S$.
With $A:=k[x, y] \hookrightarrow B:=k[[y]][x] \hookrightarrow C:=k[x][[y]] \hookrightarrow$ $D:=k[[x, y]]$, the generic fiber ring of $A \hookrightarrow R$ is one-dim. for $R \in\{B, C, D\}$, while the generic fiber ring of $R \hookrightarrow S$ is zero-dim for $R \subseteq S$ in $\{B, C, D\}$.

## Trivial generic fiber extensions

Let $R$ be a subring of an integral domain $S$.
Definition. $R \hookrightarrow S$ is a trivial generic fiber extension or a TGF extension if
$(0) \neq P \in \operatorname{Spec} S \Longrightarrow P \cap R \neq(0)$.

## Trivial generic fiber extensions

Let $R$ be a subring of an integral domain $S$.
Definition. $R \hookrightarrow S$ is a trivial generic fiber extension or a TGF extension if
$(0) \neq P \in \operatorname{Spec} S \Longrightarrow P \cap R \neq(0)$.
A TGF extension $S$ of $R$ is gotten via

$$
R \hookrightarrow T \rightarrow T / P:=S,
$$

where $T$ is an extension ring of $R$ and $P \in \operatorname{Spec} T$ is maximal with respect to $P \cap R=(0)$. Thus the generic fiber ring of $R \hookrightarrow T$ is relevant to constructing TGF extensions $S$ of $R$.

## A TGF Extension

Let $x$ and $y$ be indeterminates over a field $k$. Then

$$
R:=k[[x, y]] \hookrightarrow S:=k[[x]]\left[\left[\frac{y}{x}\right]\right] \quad \text { is TGF. }
$$

## A TGF Extension

Let $x$ and $y$ be indeterminates over a field $k$. Then

$$
R:=k[[x, y]] \hookrightarrow S:=k[[x]]\left[\left[\frac{y}{x}\right]\right] \quad \text { is TGF. }
$$

Proof. It suffices to show $P \cap R \neq(0)$ for each $P \in \operatorname{Spec} S$ with ht $P=1$. This is clear if $x \in P$, while if $x \notin P$, then $k[[x]] \cap P=(0)$, so $k[[x]] \hookrightarrow R /(P \cap R) \hookrightarrow S / P$. Now $S / P$ is one-dim local with residue field $k$. Hence by Cohen's Theorem 8, $S / P$ is finite over $k[[x]]$. Thus $\operatorname{dim} R /(P \cap R)=1$, so $P \cap R \neq(0)$.

## Cohen's Theorem 8

Theorem (Classical) Let $I$ be an ideal of a ring $R$ and let $M$ be an $R$-module. Assume that $R$ is complete in the $I$-adic topology and $\bigcap_{n=1}^{\infty} I^{n} M=(0)$. If $M / I$ is generated over $R / I$ by elements $\bar{w}_{1}, \ldots, \bar{w}_{s}$ and $w_{i}$ is a preimage in $M$ of $\bar{w}_{i}$ for $1 \leq i \leq s$, then $M$ is generated over $R$ by $w_{1}, \ldots, w_{s}$.

## Cohen's Theorem 8

Theorem (Classical) Let $I$ be an ideal of a ring $R$ and let $M$ be an $R$-module. Assume that $R$ is complete in the $I$-adic topology and $\bigcap_{n=1}^{\infty} I^{n} M=(0)$. If $M / I$ is generated over $R / I$ by elements $\bar{w}_{1}, \ldots, \bar{w}_{s}$ and $w_{i}$ is a preimage in $M$ of $\bar{w}_{i}$ for $1 \leq i \leq s$, then $M$ is generated over $R$ by $w_{1}, \ldots, w_{s}$.

This is useful for proving that with

$$
B:=k[[y]][x] \hookrightarrow C:=k[x][[y]] \hookrightarrow D:=k[[x, y]],
$$

then $R \hookrightarrow S$ is TGF for $R \subseteq S$ in $\{B, C, D\}$.

## TGF Extensions

PROP. 1. Let $R \hookrightarrow S$ and $S \hookrightarrow T$ be injective maps, where $R, S$ and $T$ are integral domains.
(1) If $R \hookrightarrow S$ and $S \hookrightarrow T$ are TGF extensions, then so is $R \hookrightarrow T$. Equivalently if $R \hookrightarrow T$ is not TGF, then at least one of the extensions $R \hookrightarrow S$ or $S \hookrightarrow T$ is not TGF.

## TGF Extensions

PROP. 1. Let $R \hookrightarrow S$ and $S \hookrightarrow T$ be injective maps, where $R, S$ and $T$ are integral domains.
(1) If $R \hookrightarrow S$ and $S \hookrightarrow T$ are TGF extensions, then so is $R \hookrightarrow T$. Equivalently if $R \hookrightarrow T$ is not TGF, then at least one of the extensions $R \hookrightarrow S$ or $S \hookrightarrow T$ is not TGF.
(2) If $R \hookrightarrow T$ is TGF, then $S \hookrightarrow T$ is TGF.
(3) If the $\operatorname{map} \operatorname{Spec} T \rightarrow \operatorname{Spec} S$ is surjective, then $R \hookrightarrow T$ is TGF implies $R \hookrightarrow S$ is TGF.

## A NON-TGF EXTENSION

## PROP. 2. $R=k[[x]][y, z] \hookrightarrow k[y, z][[x]]=S$ is not TGF.

## A NON-TGF EXTENSION

PROP. 2. $R=k[[x]][y, z] \hookrightarrow k[y, z][[x]]=S$ is not TGF. Proof. There exists $\sigma \in k[y][[x]]$ that is transcendental over $k[[x]][y]$. Let $\mathbf{q}=(z-\sigma x) k[y, z][[x]]$ and define $\pi: k[y, z][[x]] \rightarrow k[y, z][[x]] / \mathbf{q} \cong k[y][[x]]$. Thus $\pi(z)=\sigma x$. If $h \in \mathbf{q} \cap(k[[x]][y, z])$, then $\exists s, t \in \mathbb{N}$ so that $h=\sum_{i=0}^{s} \sum_{j=0}^{t}\left(\sum_{\ell \in \mathbb{N}} a_{i j \ell} x^{\ell}\right) y^{i} z^{j}, \quad$ where $a_{i j \ell} \in k$.

## A NON-TGF EXTENSION

PROP. 2. $R=k[[x]][y, z] \hookrightarrow k[y, z][[x]]=S$ is not TGF. Proof. There exists $\sigma \in k[y][[x]]$ that is transcendental over $k[[x]][y]$. Let $\mathbf{q}=(z-\sigma x) k[y, z][[x]]$ and define $\pi: k[y, z][[x]] \rightarrow k[y, z][[x]] / \mathbf{q} \cong k[y][[x]]$. Thus $\pi(z)=\sigma x$. If $h \in \mathbf{q} \cap(k[[x]][y, z])$, then $\exists s, t \in \mathbb{N}$ so that $h=\sum_{i=0}^{s} \sum_{j=0}^{t}\left(\sum_{\ell \in \mathbb{N}} a_{i j \ell} x^{\ell}\right) y^{i} z^{j}, \quad$ where $a_{i j \ell} \in k$. Hence $0=\pi(h)=\sum_{i=0}^{s} \sum_{j=0}^{t}\left(\sum_{\ell \in \mathbb{N}} a_{i j \ell} x^{\ell}\right) y^{i}(\sigma x)^{j}$. Since $\sigma$ is transcendental over $k[[x]][y]$, each $a_{i j \ell}=0$. Therefore $\mathbf{q} \cap(k[[x]][y, z])=(0)$, and $R \hookrightarrow S$ is not TGF.

## Power Series Rings 1

Lemma. Let $R[[y]]$ denote the power series ring in the variable $y$ over the commutative ring $R$. Then
(1) Each maximal ideal of $R[[y]]$ has the form $(\mathbf{m}, y) R[[y]]$, where $\mathbf{m}$ is a maximal ideal of $R$. Thus $y$ is in every maximal ideal of $R[[y]]$.

## Power Series Rings 1

Lemma. Let $R[[y]]$ denote the power series ring in the variable $y$ over the commutative ring $R$. Then
(1) Each maximal ideal of $R[[y]]$ has the form $(\mathbf{m}, y) R[[y]]$, where $\mathbf{m}$ is a maximal ideal of $R$. Thus $y$ is in every maximal ideal of $R[[y]]$.
(2) If $R$ is Noetherian with $\operatorname{dim} R[[y]]=n$ and $x_{1}, \ldots, x_{m}$ are indeterminates over $R[[y]]$, then $y$ is in every maximal ideal of height $n+m$ of the polynomial ring $R[[y]]\left[x_{1}, \ldots, x_{m}\right]$.

## Power Series Rings 2

Lemma. Let $R$ be an $n$-dim. Noetherian domain and let $\mathbf{q}$ be a prime ideal of height $n$ in the power series ring $R[[y]]$. If $y \notin \mathbf{q}$, then $\mathbf{q}$ is contained in a unique maximal ideal of $R[[y]]$.

## Power Series Rings 2

Lemma. Let $R$ be an $n$-dim. Noetherian domain and let $\mathbf{q}$ be a prime ideal of height $n$ in the power series ring $R[[y]]$. If $y \notin \mathbf{q}$, then $\mathbf{q}$ is contained in a unique maximal ideal of $R[[y]]$.
Proof. Let $S:=R[[y]] / \mathbf{q}$. The assertion is clear if $\mathbf{q}$ is maximal. Otherwise, $\operatorname{dim} S=1$. Moreover, $S$ is complete in its $y S$-adic topology and every maximal ideal of $S$ is a minimal prime of the principal ideal $y S$. Hence $S$ is a complete semilocal ring. Since $S$ is also an integral domain, it is local by [Mat., Theorem 8.15]. Thus $\mathbf{q}$ is contained in a unique maximal ideal of $R[[y]]$.

## $\operatorname{Spec} k[[y]][x]$

$\beta$ is the cardinality of $k[[y]]$, and $\alpha$ is the cardinality of the set of maximal ideals of $k[x]$; the boxed $\beta$ means there are cardinality $\beta$ height-one primes in that

## $\operatorname{Spec} k[x][[y]]$

Here $\alpha$ is the cardinality of the set of maximal ideals of $k[x]$, and $\beta$ is the uncountable cardinal equal to the cardinality of $k[[y]]$.

## $\operatorname{Spec} R[[y]]$

## $\operatorname{Spec} R[[y]]$ for $R$ a one-dim Noetherian domain

Here $\kappa_{i}$ and $\kappa_{j}$ are uncountable cardinals.

## Isomorphic Spectra

REMARK. Let $F$ be a field that is algebraic over a finite field. Roger Wiegand proved that as partially ordered sets or topological spaces

$$
\operatorname{Spec} \mathbb{Q}[x, y] \not \approx \operatorname{Spec} F[x, y] \cong \operatorname{Spec} \mathbb{Z}[y] .
$$

The spectra of power series extensions in $y$ behave differently: we have

$$
\operatorname{Spec} \mathbb{Z}[[y]] \cong \operatorname{Spec} \mathbb{Q}[x][[y]] \cong \operatorname{Spec} F[x][[y]] .
$$

## Higher dimension

We display several extensions involving three variables:

$$
\begin{aligned}
& k[[z]][x, y] \stackrel{\beta}{\hookrightarrow} k[x][[z]][y] \stackrel{\gamma}{\hookrightarrow} k[x, y][[z]] \stackrel{\delta}{\hookrightarrow} k[x][[y, z]], \\
& k[[z]][x, y] \stackrel{\varepsilon}{\hookrightarrow} k[[y, z]][x] \stackrel{\zeta}{\hookrightarrow} k[x][[y, z]] \stackrel{\eta}{\hookrightarrow} k[[x, y, z]],
\end{aligned}
$$

We have been able to show many of these extensions are not TGF.

## ANOTHER NON TGF EXTENSION

PROP. 3. $k[z]][x, y] \stackrel{\beta}{\hookrightarrow} k[x][z]][y]$ is not TGF.

## ANOTHER NON TGF EXTENSION

PROP. 3. $\quad k[[z]][x, y] \stackrel{\beta}{\hookrightarrow} k[x][[z]][y]$ is not TGF. Proof. Fix $\sigma \in k[x][[z]]$ that is transcendental over $k[[z]][x]$. Define $\pi: k[x][[z]][y] \rightarrow k[x][[z]]$ to be the identity map on $k[x][[z]]$ and $\pi(y)=\sigma z$. Let $\mathbf{q}=\operatorname{ker} \pi$. Then $y-\sigma z \in \mathbf{q}$. If $h \in \mathbf{q} \cap(k[[z]][x, y])$, then $h=$

## ANOTHER NON TGF EXTENSION

PROP. 3. $\quad k[[z]][x, y] \stackrel{\beta}{\hookrightarrow} k[x][[z]][y]$ is not TGF. Proof. Fix $\sigma \in k[x][[z]]$ that is transcendental over $k[[z]][x]$. Define $\pi: k[x][[z]][y] \rightarrow k[x][[z]]$ to be the identity map on $k[x][[z]]$ and $\pi(y)=\sigma z$. Let $\mathbf{q}=\operatorname{ker} \pi$. Then $y-\sigma z \in \mathbf{q}$. If $h \in \mathbf{q} \cap(k[[z]][x, y])$, then $h=$

$$
\sum_{j=0}^{s} \sum_{i=0}^{t}\left(\sum_{\ell \in \mathbb{N}} a_{i j \ell} z^{\ell}\right) x^{i} y^{j}, \text { for } s, t \in \mathbb{N} \text { and } a_{i j \ell} \in k
$$

## THEREFORE

$$
\begin{gathered}
0=\pi(h)=\sum_{j=0}^{s} \sum_{i=0}^{t}\left(\sum_{\ell \in \mathbb{N}} a_{i j \ell} z^{\ell}\right) x^{i}(\sigma z)^{j}= \\
\sum_{j=0}^{s} \sum_{i=0}^{t}\left(\sum_{\ell \in \mathbb{N}} a_{i j \ell} z^{\ell+j}\right) x^{i} \sigma^{j}
\end{gathered}
$$

Since $\sigma$ is trans. over $k[[z]][x], \quad x$ and $\sigma$ are alg. indep. over $k((z))$. Thus each $a_{i j \ell}=0$. Therefore $\mathbf{q} \cap(k[[z]][x, y])=(0)$, and the embedding $\beta$ is not TGF.

## Question

Is $k[x, y][[z]] \stackrel{\theta}{\hookrightarrow} k[x, y, 1 / x][[z]]$ TGF?
REMARK. For $k$ a field and $x, y, u$ and $z$ indeterminates over $k$, the extension
$k[x, y, u][[z]] \hookrightarrow k[x, y, u, 1 / x],[[z]]$ is not TGF.
