Stat 479
Fall 2009
Quiz 10

## December 3, 2009

1. You have the following sample from a distribution:

$$
6,6,8,10,10,10,14,14,16,19
$$

$\theta_{M}$ is the estimated parameter for an exponential distribution using the Method of Moments.
$\theta_{\mathrm{P}}$ is the estimated parameter for an exponential distribution using the Method of Percentile Matching using the $60^{\text {th }}$ percentile.

Calculate $1000\left(\theta_{\mathrm{P}}-\theta_{\mathrm{M}}\right)$.
2. One hundred laptop computers are observed for a period of 12 months. Thirty laptops malfunction during the observation period, with the following distribution:

| Time Till Malfunction <br> in Months | Number of <br> Malfunctions |
| :---: | :---: |
| 1 | 8 |
| 2 | 6 |
| 3 | 0 |
| 4 | 0 |
| 5 | 1 |
| 6 | 0 |
| 7 | 1 |
| 8 | 2 |
| 9 | 2 |
| 10 | 3 |
| 11 | 3 |
| 12 | 4 |

The remaining seventy laptops are still functioning at the end of 12 months.
The lifetime of a laptop is believed to follow an exponential survival function with mean of $\theta$.

Calculate the maximum likelihood estimate of $\theta$.
