# INVERSE OBSTACLE SCATTERING IN AN UNBOUNDED STRUCTURE 

GANG BAO, HUAYAN LIU, PEIJUN LI, AND LEI ZHANG*

#### Abstract

This paper is concerned with the acoustic scattering of a point incident wave by a sound hard obstacle embedded in a two-layered lossy background medium which is separated by an infinite rough surface. Given the point incident wave, the direct scattering problem is to determine the acoustic wave field for the given obstacle and infinite rough surface; the inverse scattering problem is to determine both the obstacle and the infinite rough surface from the reflected and transmitted wave fields measured on two plane surfaces enclosing the structure. For the direct scattering problem, the well-posedness is studied by using the the method of boundary integral equations. For the inverse scattering problem, we prove that the obstacle and the infinite rough surface can be uniquely determined by the measured wave fields corresponding to a single point incident wave. To prove the local stability, the domain derivative of the wave field with respect to the change of the shapes of the obstacle and the infinite rough surface is examined. The local stability indicates that the Hausdorff distance of two domains is bounded above by the distance of corresponding wave fields if the two domains are close enough.

## 1. Introduction

This paper is concerned with the scattering of a point incident wave by an obstacle embedded in a two-layered background medium which is separated by an infinite rough surface. An obstacle is an impenetrable object which has a compact support; an infinite rough surface is referred to as a nonlocal perturbation of an infinite plane surface such that the whole surface lies within a finite distance of the original plane. Given the point incident wave, the direct scattering problem is to determine the wave field for the known composite medium consisting of the obstacle and the infinite rough surface; the inverse scattering problem is to determine simultaneously the obstacle and the infinite rough surface by the measured wave fields. The scattering problems arise in diverse scientific areas, such as modeling the optical scattering from obstacles and interfaces of materials in nanooptics, the acoustic wave propagation over the ground and sea surfaces in remote sensing, and the radar object recognition above the sea surface or detection of underwater mines.

Specifically, we study the scattering of a time-harmonic acoustic wave, which is generated by a point source, by a sound hard obstacle and an infinite rough surface. The space above and below the infinite rough surface is filled with a homogeneous and isotropic energy absorbing material, respectively. The wave propagation is modeled by the two-dimensional Helmholtz equation. The scattering problems in such a composite medium are challenging due to the unbounded nature of the interface and the nonlinearity associated with the inverse problem. These scattering problems have received considerable attention and a large amount of work have been done. The recent developments can be found in $[25,26,33]$ on the shape and impedance parameter reconstruction in

[^0]the inverse obstacle scattering problems. The characterization of domain derivatives with respect to local boundary disturbance were studied by Hettlich [20], Hiptmair and Li [22], Kirsch [23], Li [28], Potthast [38]. However, few results are available for rigorous analysis of the obstacle scattering problem in unbounded structures. Our goal is to examine mathematically both the direct and the inverse scattering problems in such a setting.

It is worth mentioning that considerable results are available for the scattering problems in unbounded structures. For unbounded periodic surfaces, many mathematical analysis and numerical computation have been done for both the direct and inverse scattering problems, see Bao [10], Bao, Cui and Li [11], Nédélec and Starling [37], Bao et al. [5] and references cited therein. For the local rough surface scattering problems, Li [28] considered an inverse cavity problem for Maxwell's equations, and showed the global uniqueness and a local stability to reconstruct the cavity wall. Ammari et al. [1] studied the method of integral equations for the electromagnetic scattering from open cavities. An optimization method was introduced in [3] to recover a local rough surface. In [4], a continuation approach over the wave frequency was developed for reconstructing a local rough surface. We refer to Bao et al. [2], Bao and Sun [6], Bao and Lai [9], Li et al. [30], Kress and Tran [24], Zhang and Zhang [42] for various mathematical and numerical methods to solve the local rough surface scattering problems. For the general unbounded non-periodic rough surfaces, the usual Sommerfeld or Silver-Müller radiation condition is not valid any more. Some appropriate radiation condition needs to be given as a part of the boundary value problem. In [16,17,41], Chandler-Wilde and Zhang proposed an upward going radiation condition to replace the usual Sommerfeld radiation condition for the scattering problem by rough surfaces and inhomogeneous layers. The well-posedness was established by Chandler-Wilde and Monk [18] for the two-dimensional Helmholtz equation by using a variational approach. Chandler-Wilde et al. [19] studied the well-posedness for the three-dimensional rough surface scattering problem by the method of boundary integral equations. By introducing a transparent boundary condition, Li et al. [27,31] proved the existence and uniqueness of the weak solution for the electromagnetic scattering problem in an unbounded structure. Lu and Zhang [35] studied the direct and inverse scattering problem by an unbounded rough interface with buried obstacles. When the scattering profile is a sufficiently small and smooth deformation of a plane surface, the analytical solution was introduced in [29] by using a boundary perturbation technique combined with the transformed field expansion. He et al. proposed a spectral method in [21] to solve the unbounded rough surface scattering problem. Zhang et al. [43] developed a regularized conjugate gradient method with fast multipole acceleration for a fractal rough surface scattering problem. We refer to $[7,8,12,13,32,34,40]$ for some mathematical and numerical studies on related inverse scattering problems.

In this work, we introduce an integral radiation condition for the direct scattering problem. The asymptotic behaviour of Green's function is presented. Based on some energy estimates, the uniqueness of the solution is established for the direct scattering problem. The method of boundary integral equations is employed to address the existence of the direct scattering problem. The direct approach is presented to drive the system of boundary integral equations and its well-posedness is discussed. For the inverse problem, we prove that the obstacle and the infinite rough surface are uniquely determined by the reflected and transmitted wave fields measured on the plane surfaces which are above and below the infinite rough surface, respectively. The proof is based on a combination of the Holmgren uniqueness and unique continuation. Based on the well-posedness arguments for the direct scattering problem, we obtain the domain derivative of the wave field with respect to the change of the shapes of the obstacle and the infinite rough surface. Moreover, a local stability is established. It indicates that the Hausdorff distance of two domains, which are characterized by two different obstacles and infinite rough surfaces, is bounded above by the distance of corresponding wave fields if the two obstacles and infinite rough surfaces are close enough.

The outline of the paper is as follows. In Section 2, the model problem is introduced and some asymptotic properties are given for the Green function. Section 3 addresses the solution of the direct

Figure 1. Schematic of the scattering of a point source by an obstacle embedded in a two-layered background medium which is separated by an infinite rough surface.
scattering problem. The uniqueness is proved. The boundary integral equations are presented and the well-posedness is discussed. The inverse problem is studied in Sections 4 and 5. The global uniqueness of the inverse problem is obtained in Section 4. Section 5 is devoted to the study of the local stability. In particular, the existence and characterization of the domain derivative are examined. As a consequence of the domain derivative, a local stability result is established. The paper is concluded with some general remarks in Section 6.

## 2. Problem formulation

For $Q \subset \mathbb{R}^{2}$, denote by $B C(Q)$ the set of bounded and continuous functions on $Q$. It is a Banach space under the norm

$$
\|\phi\|_{\infty}:=\sup _{x \in Q}|\phi(x)| .
$$

For $0<\alpha \leq 1$, denote by $C^{0, \alpha}(Q)$ the Banach space of functions $\phi \in B C(Q)$, which are Hölder continuous with the exponent $\alpha$. The norm is defined by

$$
\|\phi\|_{C^{0, \alpha}(Q)}:=\|\phi\|_{\infty}+\sup _{\substack{x, y \in Q \\ x \neq y}} \frac{|\phi(x)-\phi(y)|}{|x-y|^{\alpha}} .
$$

Let $C^{1, \alpha}(Q)=\left\{\phi \in B C(Q) \cap C^{1}(Q): \nabla \phi \in C^{0, \alpha}(Q)^{2}\right\}$, which is a Banach space under the norm

$$
\|\phi\|_{C^{1, \alpha}(Q)}:=\|\phi\|_{\infty}+\|\nabla \phi\|_{C^{0, \alpha}(Q)^{2}} .
$$

Let $\nu_{\Gamma}$ be the unit normal vector on $\Gamma$ directed into the exterior of $D$ and let $\nu_{S}$ be the unit normal vector on the boundary $S$ pointing from region $\Omega_{2}$ to region $\Omega_{1}$. Define

$$
V_{\Gamma_{\tau}}=\nu_{\Gamma} \times\left(V \times \nu_{\Gamma}\right) \quad \text { or } \quad V_{S_{\tau}}=\nu_{S} \times\left(V \times \nu_{S}\right)
$$

and

$$
V_{\Gamma_{\nu}}=\nu_{\Gamma} \cdot V \quad \text { or } \quad V_{S_{\nu}}=\nu_{S} \cdot V
$$

which are the tangential and the normal components of the vector $V$ on $\Gamma$ or $S$. Any vector $V$ can be decomposed into its tangential and normal components

$$
\left.V\right|_{\Gamma}=V_{\Gamma_{\tau}}+V_{\Gamma_{\nu}} \nu_{\Gamma},\left.\quad V\right|_{S}=V_{S_{\tau}}+V_{S_{\nu}} \nu_{S}
$$

Denote by $\nabla_{\Gamma_{\tau}}$ and $\nabla_{S_{\tau}}$ the surface gradient on $\Gamma$ and $S$, respectively. It is clear to note that

$$
\left.\nabla v\right|_{\Gamma}=\nabla_{\Gamma_{\tau}} v+\left(\nu_{\Gamma} \cdot \nabla v\right) \nu_{\Gamma},\left.\quad \nabla v\right|_{S}=\nabla_{S_{\tau}} v+\left(\nu_{S} \cdot \nabla v\right) \nu_{S},
$$

if $v$ is a smooth scalar function defined in a neighborhood of $\Gamma \cup S$.

Now let us specify the problem geometry, which is shown in Figure 1. Let $S$ be an infinite rough surface which can be described by

$$
S=\left\{x=\left(x_{1}, x_{2}\right) \in \mathbb{R}^{2}: x_{2}=f\left(x_{1}\right)\right\},
$$

where $f \in C^{2}(\mathbb{R})$. Let

$$
f_{-}=\inf _{x_{1} \in \mathbb{R}} f\left(x_{1}\right), \quad f_{+}=\sup _{x_{1} \in \mathbb{R}} f\left(x_{1}\right)
$$

We assume that

$$
-\infty<h_{-} \leq f_{-}<f_{+} \leq h_{+}<\infty
$$

where $h_{-}$and $h_{+}$are two constants. Hence the surface $S$ divides the whole space $\mathbb{R}^{2}$ into the upper half space $\Omega_{1}^{+}$and the lower half space $\Omega_{2}$, where

$$
\Omega_{1}^{+}=\left\{x \in \mathbb{R}^{2}: x_{2}>f\left(x_{1}\right)\right\}, \quad \Omega_{2}=\left\{x \in \mathbb{R}^{2}: x_{2}<f\left(x_{1}\right)\right\}
$$

Let $D$ be a bounded obstacle with $C^{2}$ boundary $\Gamma$. Without loss of generality, the obstacle is assumed to be immersed in the upper half space $\Omega_{1}^{+}$, i.e., $D \subset \subset \Omega_{1}^{+}$. Define $\Omega_{1}=\Omega_{1}^{+} \backslash \bar{D}$. The results will be same for the case when $D \subset \subset \Omega_{2}$. Let $\Gamma_{j}=\left\{x \in \mathbb{R}^{2}: x_{2}=h_{j}\right\}, j=1,2$ be the plane surface above the obstacle and below the infinite rough surface, respectively, where the constants $h_{1}, h_{2}$ satisfy $h_{2}<h_{-}<h_{+}<h_{1}$. Define $R_{1}=\left\{x \in \mathbb{R}^{2}: f\left(x_{1}\right)<x_{2}<h_{1}\right\}$ and $R_{2}=\left\{x \in \mathbb{R}^{2}: h_{2}<x_{2}<f\left(x_{1}\right)\right\}$. Let $R=R_{1} \cup R_{2} \cup S$.

For a homogeneous medium in the region $\Omega_{j}, j=1,2$, the Green function is defined by the solution of the following equation

$$
\begin{equation*}
\Delta G_{j}(x, y)+k_{j}^{2} G_{j}(x, y)=-\delta(x-y), \quad x \in \Omega_{j} \tag{2.1}
\end{equation*}
$$

where $k_{j}$ is the wavenumber in $\Omega_{j}$ and is assumed to satisfy

$$
\Re k_{j}^{2}>0, \quad \Im k_{j}^{2}>0, \quad \Im k_{j}>0,
$$

which accounts for energy absorbing media. Explicitly, we have

$$
\begin{equation*}
G_{j}(x, y)=\frac{\mathrm{i}}{4} H_{0}^{(1)}\left(k_{j}|x-y|\right), \tag{2.2}
\end{equation*}
$$

where $H_{0}^{(1)}$ is the Hankel function of the first kind with order zero.
Let $u^{i}$ be a point incident wave located at $x_{s} \in R_{1}^{+}=\left\{x \in \mathbb{R}^{2}: x_{2}>h_{1}\right\}$. It is given by

$$
\begin{equation*}
u^{i}(x)=G_{1}\left(x, x_{s}\right) \quad \text { in } \Omega_{1} . \tag{2.3}
\end{equation*}
$$

It follows from (2.1) that the incident wave satisfies

$$
\begin{equation*}
\Delta u^{i}(x)+k_{1}^{2} u^{i}(x)=-\delta\left(x-x_{s}\right) \quad \text { in } \Omega_{1} . \tag{2.4}
\end{equation*}
$$

When the incident wave impinges the infinite rough surface $S$ and the obstacle $D$, the scattered wave $u^{s}$ and the transmitted wave $u_{2}$ will be generated in $\Omega_{1}$ and $\Omega_{2}$, respectively. Let $u_{1}=u^{i}+u^{s}$. It can be verified that the total field $u_{j}$ satisfies

$$
\begin{equation*}
\Delta u_{1}(x)+k_{1}^{2} u_{1}(x)=-\delta\left(x-x_{s}\right), \quad x \in \Omega_{1} \tag{2.5}
\end{equation*}
$$

and

$$
\begin{equation*}
\Delta u_{2}(x)+k_{2}^{2} u_{2}(x)=0, \quad x \in \Omega_{2} \tag{2.6}
\end{equation*}
$$

The obstacle is assumed to be a sound hard, i.e.,

$$
\begin{equation*}
\frac{\partial u_{1}}{\partial \nu_{\Gamma}}=0 \quad \text { on } \Gamma . \tag{2.7}
\end{equation*}
$$

The continuity conditions require that $u_{1}$ and $u_{2}$ satisfy

$$
\begin{equation*}
u_{1}=u_{2}, \quad \frac{\partial u_{1}}{\partial \nu_{S}}=\frac{\partial u_{2}}{\partial \nu_{S}} \quad \text { on } S . \tag{2.8}
\end{equation*}
$$

Here

$$
\frac{\partial u_{1}}{\partial \nu_{\Gamma}}(x):=\lim _{\sigma \rightarrow 0^{+}} \nu_{\Gamma}(x) \cdot \nabla u_{1}\left(x+\sigma \nu_{\Gamma}(x)\right), \quad x \in \Gamma
$$

and

$$
\frac{\partial u_{1}}{\partial \nu_{S}}(x):=\lim _{\sigma \rightarrow 0^{+}} \nu_{S}(x) \cdot \nabla u_{1}\left(x+\sigma \nu_{S}(x)\right), \quad \frac{\partial u_{2}}{\partial \nu_{S}}(x):=\lim _{\sigma \rightarrow 0^{+}} \nu_{S}(x) \cdot \nabla u_{2}\left(x-\sigma \nu_{S}(x)\right), \quad x \in S .
$$

It was shown in [29] that a transparent boundary condition can be imposed on $\Gamma_{j}, j=1,2$ :

$$
\begin{equation*}
\frac{\partial u_{j}}{\partial \nu_{\Gamma_{j}}}=T_{j} u_{j}+\rho_{j} \quad \text { on } \Gamma_{j}, \tag{2.9}
\end{equation*}
$$

where $\nu_{\Gamma_{j}}$ is the unit normal vector on $\Gamma_{j}, T_{j}$ is the boundary operator given by

$$
\left(T_{j} u\right)\left(x_{1}, h_{j}\right)=\int_{\mathbb{R}} \mathrm{i} \beta_{j}(\xi) \hat{u}\left(\xi, h_{j}\right) e^{\mathrm{i} \xi x_{1}} \mathrm{~d} \xi,
$$

with

$$
\beta_{j}^{2}(\xi)=k_{j}^{2}-\xi^{2}, \quad \Im \beta_{j}(\xi)>0
$$

and

$$
\rho_{1}=\frac{\partial u^{i}}{\partial \nu_{\Gamma_{j}}}-T_{1} u^{i}, \quad \rho_{2}=0 .
$$

An appropriate radiation condition is needed since the problem is imposed in the open space $\mathbb{R}^{2} \backslash \bar{D}$. Due to the infinite extend of the surface $S$, the usual Sommerfeld radiation condition is not valid. We propose an integral radiation condition which corresponds to the lossy media where $\Im k_{j}>0, j=1,2$ :

$$
\begin{equation*}
\lim _{r \rightarrow+\infty} \int_{\partial B_{r}^{+}}\left(\left|u^{s}\right|^{2}+\left|\frac{\partial u^{s}}{\partial \nu}\right|^{2}\right) \mathrm{d} s=0, \quad \lim _{r \rightarrow+\infty} \int_{\partial B_{r}^{-}}\left(\left|u_{2}\right|^{2}+\left|\frac{\partial u_{2}}{\partial \nu}\right|^{2}\right) \mathrm{d} s=0 \tag{2.10}
\end{equation*}
$$

where $\nu$ denote the unit normal vector on the boundary $\partial B_{r}$ directed into the exterior of $B_{r}(O)$. Here $B_{r}(O)$ is a ball centered at the origin with radius $r$ and boundary $\partial B_{r}=\partial B_{r}^{+} \cup \partial B_{r}^{-}$, where $\partial B_{r}^{+}$and $\partial B_{r}^{-}$denote the semi-circle above and below $S$, respectively.

Given the point incident field $u^{i}$ in (2.3), the direct scattering problem is to find $u_{1}$ and $u_{2}$ which satisfy (2.5)-(2.8) and (2.10); the inverse scattering problem is to determine simultaneously the boundary of the obstacle $\Gamma$ and the infinite rough surface $S$ from the measured wave field $u_{j}$ on $\Gamma_{j}, j=1,2$. We study both of the direct and inverse scattering problems.

Denote by $\mathcal{T}_{j}$ the set of functions $\phi \in C^{2}\left(\Omega_{j}\right) \cap C^{1, \alpha}\left(\bar{\Omega}_{j}\right), j=1,2$. More specifically, the scattering problem can be stated as follows.

Problem 2.1. Given the incident field $u^{i}$ in (2.3), the direct scattering problem is to determine $u^{s} \in \mathcal{T}_{1}$ and $u_{2} \in \mathcal{T}_{2}$ such that
(i) The total fields $u_{1}=u^{s}+u^{i}$ and $u_{2}$ satisfy (2.5) and (2.6), respectively;
(ii) The total field $u_{1}$ satisfies the sound hard boundary condition (2.7);
(iii) The total fields $u_{1}$ and $u_{2}$ satisfy the transmission boundary conditions (2.8);
(iv) The scattered fields $u^{s}$ and the transmitted fields $u_{2}$ satisfy the radiation conditions (2.10).

The following result gives the asymptotic behaviour of the Green function and plays an important role when formulating the boundary integral equations for the direct scattering problem.
Lemma 2.2. For each fixed $y \in \Omega_{j}, j=1,2$, the Green function $G_{j}$ admits the asymptotic behaviour

$$
\left|G_{j}(x, y)\right|,\left|\frac{\partial G_{j}(x, y)}{\partial \nu(y)}\right|,\left|\frac{\partial^{2} G_{j}(x, y)}{\partial \nu(x) \partial \nu(y)}\right| \leq C\left(\frac{\exp \left(-\frac{1}{2} \Im\left(k_{j}\right)|x|\right)}{|x|^{\frac{1}{2}}}\right), \quad|x| \rightarrow \infty
$$

where $C$ is a constant independent of $x$ and $y$.

Proof. A simple calculation yields

$$
\frac{\partial G_{j}(x, y)}{\partial x_{l}}=-\frac{\partial G_{j}(x, y)}{\partial y_{l}}=-\frac{\mathrm{i} k_{j}\left(x_{l}-y_{l}\right)}{4|x-y|} H_{1}^{(1)}\left(k_{j}|x-y|\right), \quad l=1,2,
$$

and

$$
\begin{aligned}
\frac{\partial^{2} G_{j}(x, y)}{\partial x_{m} \partial y_{l}}= & \frac{\mathrm{i} k_{j}}{4}\left[\frac{k_{j}\left(x_{m}-y_{m}\right)\left(x_{l}-y_{l}\right)}{|x-y|^{2}} H_{0}^{(1)}\left(k_{j}|x-y|\right)+\frac{\delta_{m l}}{|x-y|} H_{1}^{(1)}\left(k_{j}|x-y|\right)\right. \\
& \left.-2 \frac{\left(x_{m}-y_{m}\right)\left(x_{l}-y_{l}\right)}{|x-y|^{3}} H_{1}^{(1)}\left(k_{j}|x-y|\right)\right], \quad l, m=1,2
\end{aligned}
$$

where $H_{1}^{(1)}$ is the Hankel function of the first kind with order one and $\delta_{m l}$ is the Kronecker delta function. Using the asymptotic expansion

$$
\begin{aligned}
H_{\mu}^{(1)}\left(k_{j}|x-y|\right) & \simeq \sqrt{\frac{2}{\pi k_{j}|x-y|}} \exp \left(\mathrm{i}\left(k_{j}|x-y|-\mu \frac{\pi}{2}-\frac{\pi}{4}\right)\right) \\
& =\frac{2 \exp \left(-\mathrm{i}\left(\mu \frac{\pi}{2}+\frac{\pi}{4}\right)\right)}{\sqrt{2 \pi k_{j}}}\left[\frac{\exp \left(\mathrm{i} k_{j}|x-y|\right)}{|x-y|^{\frac{1}{2}}}\right], \quad|x-y| \rightarrow+\infty, \mu=0,1,
\end{aligned}
$$

we have

$$
\begin{equation*}
\left|G_{j}(x, y)\right|,\left|\frac{\partial G_{j}(x, y)}{\partial \nu(y)}\right|,\left|\frac{\partial^{2} G_{j}(x, y)}{\partial \nu(x) \partial \nu(y)}\right| \leq C_{1}\left[\frac{\exp \left(-\Im\left(k_{j}\right)|x-y|\right)}{|x-y|^{\frac{1}{2}}}\right], \quad|x-y| \rightarrow+\infty \tag{2.11}
\end{equation*}
$$

where $C_{1}$ is a constant independent of $x$ and $y$.
For each fixed $y \in \Omega_{j}, j=1,2$, we have $\hat{x} \cdot y<\frac{|x|}{2}$ for $|x| \rightarrow \infty$, where $\hat{x}=x /|x|$. Since

$$
\begin{equation*}
|x-y|=\sqrt{|x|^{2}-2 x \cdot y+|y|^{2}}=|x|-\hat{x} \cdot y+\mathcal{O}\left(\frac{1}{|x|}\right) \geq \frac{|x|}{2}+\mathcal{O}\left(\frac{1}{|x|}\right), \quad|x| \rightarrow \infty, \tag{2.12}
\end{equation*}
$$

we conclude from $\Im\left(k_{j}\right)>0$ and (2.11)-(2.12) that there exists a constant $C$ independent of $x, y$ such that

$$
\left|G_{j}(x, y)\right|,\left|\frac{\partial G_{j}(x, y)}{\partial \nu(y)}\right|,\left|\frac{\partial^{2} G_{j}(x, y)}{\partial \nu(x) \partial \nu(y)}\right| \leq C\left(\frac{\exp \left(-\frac{1}{2} \Im\left(k_{j}\right)|x|\right)}{|x|^{\frac{1}{2}}}\right), \quad|x| \rightarrow \infty
$$

which completes the proof.

## 3. The direct scattering problem

In this section, we discuss the well-posedness of the direct scattering problem. First, the problem is shown to have a unique solution. The method of boundary integral equations is used to address the existence of the solution.

### 3.1. Uniqueness.

Theorem 3.1. The direct scattering problem has at most one solution.
Proof. Suppose that $\left(v_{1}, v_{2}\right)$ and $\left(\tilde{v}_{1}, \tilde{v}_{2}\right)$ are two solutions of Problem 2.1. Let $u_{1}=v_{1}-\tilde{v}_{1}$ and $u_{2}=v_{2}-\tilde{v}_{2}$, then $u_{j}, j=1,2$ satisfy the homogeneous Helmholtz equation $\Delta u_{j}+k_{j}^{2} u_{j}=0$ with conditions (2.7)-(2.8) and (2.10).

Denote $\Omega_{r}=\left(B_{r} \cap \Omega_{1}\right)$ with boundary $\partial \Omega_{r}=\partial B_{r}^{+} \cup \Gamma \cup S_{r}$, where $\partial B_{r}^{+}=\partial B_{r} \cap \Omega_{1}$ and $S_{r}=S \cap B_{r}$. For each fixed $x \in \Omega_{r}$, applying the Green first theorem to $u_{1}$ in $\Omega_{r}$, we have

$$
\begin{equation*}
\int_{\Omega_{r}}\left[\left|\nabla u_{1}\right|^{2}+u_{1}\left(\Delta \bar{u}_{1}\right)\right] \mathrm{d} x=\int_{\partial \Omega_{r}} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu} \mathrm{~d} s_{x}=\left(\int_{\partial B_{r}^{+}}+\int_{\Gamma}+\int_{S_{r}}\right) u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu} \mathrm{~d} s_{x}, \tag{3.1}
\end{equation*}
$$

where $\nu=\nu(x)$ stands for the unit normal vector at $x \in \partial \Omega_{r}$ pointing towards the exterior of $\Omega_{r}$. Letting $r \rightarrow+\infty$, we have from (2.7), (2.8), (2.10) and (3.1) that

$$
\begin{align*}
\int_{\Omega_{1}}\left[\left|\nabla u_{1}\right|^{2}+u_{1}\left(\Delta \bar{u}_{1}\right)\right] \mathrm{d} x & =\int_{S} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu} \mathrm{~d} s_{x}+\int_{\Gamma} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu} \mathrm{~d} s_{x} \\
& =-\int_{S} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu_{S}} \mathrm{~d} s_{x}-\int_{\Gamma} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu_{\Gamma}} \mathrm{d} s_{x} \\
& =-\int_{S} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu_{S}} \mathrm{~d} s_{x}, \tag{3.2}
\end{align*}
$$

where $\nu_{\Gamma}$ denotes the unit normal vector on the boundary $\Gamma$ directed into the exterior of $D, \nu_{S}(x)$ denotes the unit normal vector at $x \in S$ pointing from region $\Omega_{2}$ to region $\Omega_{1}$.

Using (3.2) and the homogeneous Helmholtz equation $\Delta u_{1}+k_{1}^{2} u_{1}=0$, yields

$$
\begin{align*}
\int_{\Omega_{1}}\left[\left|\nabla u_{1}\right|^{2}+u_{1}\left(\Delta \bar{u}_{1}\right)\right] \mathrm{d} x & =\int_{\Omega_{1}}\left(\left|\nabla u_{1}\right|^{2}-\overline{k_{1}^{2}}\left|u_{1}\right|^{2}\right) \mathrm{d} x \\
& =\int_{\Omega_{1}}\left(\left|\nabla u_{1}\right|^{2}-\Re\left(k_{1}^{2}\right)\left|u_{1}\right|^{2}+\mathrm{i} \Im\left(k_{1}^{2}\right)\left|u_{1}\right|^{2}\right) \mathrm{d} x \\
& =-\int_{S} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu_{S}} \mathrm{~d} s_{x}, \tag{3.3}
\end{align*}
$$

which gives by taking the imaginary part of (3.3) that

$$
\begin{equation*}
-\Im\left[\int_{S} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu_{S}} \mathrm{~d} s_{x}\right]=\Im\left(k_{1}^{2}\right) \int_{\Omega_{1}}\left|u_{1}\right|^{2} \mathrm{~d} x \geq 0 \tag{3.4}
\end{equation*}
$$

Similarly, we obtain

$$
\begin{equation*}
\Im\left[\int_{S} u_{2} \frac{\partial \bar{u}_{2}}{\partial \nu_{S}} \mathrm{~d} s_{x}\right]=\Im\left(k_{2}^{2}\right) \int_{\Omega_{2}}\left|u_{2}\right|^{2} \mathrm{~d} x \geq 0 . \tag{3.5}
\end{equation*}
$$

Noting the boundary conditions (2.8), we have

$$
\begin{equation*}
\int_{S} u_{1} \frac{\partial \bar{u}_{1}}{\partial \nu_{S}} \mathrm{~d} s_{x}=\int_{S} u_{2} \frac{\partial \bar{u}_{2}}{\partial \nu_{S}} \mathrm{~d} s_{x} . \tag{3.6}
\end{equation*}
$$

It follows immediately from combining (3.4)-(3.6) that

$$
\begin{equation*}
\Im\left(k_{1}^{2}\right) \int_{\Omega_{1}}\left|u_{1}\right|^{2} \mathrm{~d} x+\Im\left(k_{2}^{2}\right) \int_{\Omega_{2}}\left|u_{2}\right|^{2} \mathrm{~d} x=0 \tag{3.7}
\end{equation*}
$$

With the aid of $\Im\left(k_{j}^{2}\right)>0, j=1,2$, we have from (3.7) that

$$
\int_{\Omega_{1}}\left|u_{1}\right|^{2} \mathrm{~d} x=\int_{\Omega_{2}}\left|u_{2}\right|^{2} \mathrm{~d} x=0
$$

which implies that $v_{1}=\tilde{v}_{1}$ in $\Omega_{1}$ and $v_{2}=\tilde{v}_{2}$ in $\Omega_{2}$.
3.2. Potential operators. We introduce several potential operators in order to derive the boundary integral equations for the direct scattering problem.

On the infinite rough surface $S$, we define the single-layer potential operator $\mathbf{S}_{S}: C^{0, \alpha}(S) \rightarrow$ $C^{1, \alpha}(S)$ and the double-layer potential operator $\mathbf{K}_{S}: C^{1, \alpha}(S) \rightarrow C^{1, \alpha}(S)$ by

$$
\begin{aligned}
\left(\mathbf{S}_{S} \phi\right)(x) & =\int_{S}\left(G_{1}(x, y)-G_{2}(x, y)\right) \phi(y) \mathrm{d} s_{y}, \quad x \in S \\
\left(\mathbf{K}_{S} \phi\right)(x) & =\int_{S}\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)}\right) \phi(y) \mathrm{d} s_{y}, \quad x \in S,
\end{aligned}
$$

where $\phi$ is called the density. Define the normal derivative operators $\mathbf{K}_{S}^{*}: C^{0, \alpha}(S) \rightarrow C^{1, \alpha}(S)$ and $\mathbf{T}_{S}: C^{1, \alpha}(S) \rightarrow C^{0, \alpha}(S)$ by

$$
\begin{aligned}
\left(\mathbf{K}_{S}^{*} \phi\right)(x) & =\int_{S}\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(x)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(x)}\right) \phi(y) \mathrm{d} s_{y}, \quad x \in S \\
\left(\mathbf{T}_{S} \phi\right)(x) & =\frac{\partial}{\partial \nu_{S}(x)} \int_{S}\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)}\right) \phi(y) \mathrm{d} s_{y}, \quad x \in S
\end{aligned}
$$

On $\Gamma$, we define the double-layer potential operator $\mathbf{K}_{\Gamma}: C^{0, \alpha}(\Gamma) \rightarrow C^{1, \alpha}(\Gamma)$ by

$$
\left(\mathbf{K}_{\Gamma} \phi\right)(x)=2 \int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} \phi(y) \mathrm{d} s_{y}, \quad x \in \Gamma
$$

and the normal derivative operator $\mathbf{K}_{\Gamma}^{*}: C^{0, \alpha}(\Gamma) \rightarrow C^{1, \alpha}(\Gamma)$ by

$$
\left(\mathbf{K}_{\Gamma}^{*} \phi\right)(x)=2 \int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(x)} \phi(y) \mathrm{d} s_{y}, \quad x \in \Gamma
$$

Let $S_{A}=\left\{x \in S:\left|x_{1}\right| \leq A\right\}$, where $A>0$ is a constant. Define the truncated single-layer potential operator $\mathbf{S}_{A}: C^{0, \alpha}\left(S_{A}\right) \rightarrow C^{1, \alpha}(S)$ and the truncated double-layer potential operator $\mathbf{K}_{A}: C^{1, \alpha}\left(S_{A}\right) \rightarrow C^{1, \alpha}(S)$ by

$$
\begin{aligned}
\left(\mathbf{S}_{A} \phi\right)(x) & =\int_{S_{A}}\left(G_{1}(x, y)-G_{2}(x, y)\right) \phi_{2}(y) \mathrm{d} s_{y}, \quad x \in S \\
\left(\mathbf{K}_{A} \phi\right)(x) & =\int_{S_{A}}\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)}\right) \phi_{1}(y) \mathrm{d} s_{y}, \quad x \in S
\end{aligned}
$$

Similarly, we define the truncated normal derivative operators $\mathbf{K}_{A}^{*}: C^{0, \alpha}\left(S_{A}\right) \rightarrow C^{1, \alpha}(S)$ and $\mathbf{T}_{A}$ : $C^{1, \alpha}\left(S_{A}\right) \rightarrow C^{0, \alpha}(S)$ by

$$
\begin{aligned}
\left(\mathbf{K}_{A}^{*} \phi\right)(x) & =\int_{S_{A}}\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(x)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(x)}\right) \phi_{2}(y) \mathrm{d} s_{y}, \quad x \in S \\
\left(\mathbf{T}_{A} \phi\right)(x) & =\int_{S_{A}}\left(\frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)}-\frac{\partial^{2} G_{2}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)}\right) \phi_{1}(y) \mathrm{d} s_{y}, \quad x \in S .
\end{aligned}
$$

3.3. Boundary integral equations. In this section, we present the direct approach to derive the boundary integral equations for the direct scattering problem.

Let $B_{r}=\left\{x \in \mathbb{R}^{2}:|x|<r\right\}$. Denote $\Omega_{r}=B_{r} \cap \Omega_{1}$ with the boundary $\partial \Omega_{r}=\partial B_{r}^{+} \cup \Gamma \cup S_{r}$, where $\partial B_{r}^{+}=\partial B_{r} \cap \Omega_{1}$ and $S_{r}=S \cap B_{r}$. For each fixed $x \in \Omega_{r}$, applying the Green second theorem to $u_{1}$ and $G_{1}$ in the region $\Omega_{r}$, we obtain

$$
\begin{align*}
& \int_{\Omega_{r}}\left[u_{1}(y) \Delta G_{1}(x, y)-G_{1}(x, y) \Delta u_{1}(y)\right] \mathrm{d} y \\
& \quad=\int_{\partial \Omega_{r}}\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu(y)}-\frac{\partial u_{1}(y)}{\partial \nu(y)} G_{1}(x, y)\right] \mathrm{d} s_{y}, \quad x \in \Omega_{1} \tag{3.8}
\end{align*}
$$

where $\nu(y)$ stands for the unit normal vector at $y \in \partial \Omega_{r}$ pointing towards the exterior of $\Omega_{r}$.

It follows from (2.1), (2.3), and (2.5) that

$$
\begin{align*}
& \int_{\Omega_{r}}\left[u_{1}(y) \Delta G_{1}(x, y)-G_{1}(x, y) \Delta u_{1}(y)\right] \mathrm{d} y \\
& =\int_{\Omega_{r}} u_{1}(y)\left[\Delta G_{1}(x, y)+k_{1}^{2} G_{1}(x, y)\right] \mathrm{d} y-\int_{\Omega_{r}}\left[\Delta u_{1}(y)+k_{1}^{2} u_{1}(y)\right] G_{1}(x, y) \mathrm{d} y \\
& =-\int_{\Omega_{r}} \delta(x-y) u_{1}(y) \mathrm{d} y-\int_{\Omega_{r}}\left[-\delta\left(y-x_{s}\right)\right] G_{1}(x, y) \mathrm{d} y \\
& =-u_{1}(x)+G_{1}\left(x, x_{s}\right)=-\left[u_{1}(x)-u^{i}(x)\right] . \tag{3.9}
\end{align*}
$$

Letting $r \rightarrow+\infty$ and using (3.8)-(3.9), we have

$$
\begin{align*}
u_{1}(x)-u^{i}(x) & =-\lim _{r \rightarrow+\infty} \int_{\partial \Omega_{r}}\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu(y)}-\frac{\partial u_{1}(y)}{\partial \nu(y)} G_{1}(x, y)\right] \mathrm{d} s_{y} \\
& =-\left(\int_{S}+\int_{\Gamma}+\lim _{r \rightarrow+\infty} \int_{\partial B_{r}^{+}}\right)\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu(y)}-\frac{\partial u_{1}(y)}{\partial \nu(y)} G_{1}(x, y)\right] \mathrm{d} s_{y} . \tag{3.10}
\end{align*}
$$

It follows from Lemma 2.2 and the radiation conditions (2.10) that we obtain

$$
\begin{align*}
& \left|\int_{\partial B_{r}^{+}}\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu(y)}-\frac{\partial u_{1}(y)}{\partial \nu(y)} G_{1}(x, y)\right] \mathrm{d} s_{y}\right| \\
& \leq\left[\int_{\partial B_{r}^{+}}\left|u_{1}(y)\right|^{2} \mathrm{~d} s_{y}\right]^{\frac{1}{2}}\left[\int_{\partial B_{r}^{+}}\left|\frac{\partial G_{1}(x, y)}{\partial \nu(y)}\right|^{2} \mathrm{~d} s_{y}\right]^{\frac{1}{2}} \\
& \quad+\left[\int_{\partial B_{r}^{+}}\left|\frac{\partial u_{1}(y)}{\partial \nu(y)}\right|^{2} \mathrm{~d} s_{y}\right]^{\frac{1}{2}}\left[\int_{\partial B_{r}^{+}}\left|G_{1}(x, y)\right|^{2} \mathrm{~d} s_{y}\right]^{\frac{1}{2}} \rightarrow 0, \quad r \rightarrow+\infty . \tag{3.11}
\end{align*}
$$

Using (3.10)-(3.11) and the condition (ii) in Problem 2.1, and letting $r \rightarrow+\infty$, we have for each fixed $x \in \Omega_{1}$ that

$$
\begin{aligned}
& u_{1}(x)-u^{i}(x) \\
& =-\int_{S}\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu(y)}-\frac{\partial u_{1}(y)}{\partial \nu(y)} G_{1}(x, y)\right] \mathrm{d} s_{y}-\int_{\Gamma}\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu(y)}-\frac{\partial u_{1}(y)}{\partial \nu(y)} G_{1}(x, y)\right] \mathrm{d} s_{y} \\
& =\int_{S}\left[u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}-\frac{\partial u_{1}(y)}{\partial \nu_{S}(y)} G_{1}(x, y)\right] \mathrm{d} s_{y}+\int_{\Gamma} u_{1}(y) \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} \mathrm{d} s_{y},
\end{aligned}
$$

which gives

$$
\begin{array}{r}
u_{1}(x)=u^{i}(x)+\int_{S}\left[\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{1}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} \\
+\int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}, \quad x \in \Omega_{1}, \tag{3.12}
\end{array}
$$

Noting the continuity conditions (2.8), we may apply the second Green theorem to $u_{2}$ and $G_{2}$ in $\Omega_{2}$ and obtain

$$
\begin{equation*}
u_{2}(x)=-\int_{S}\left[\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{2}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y}, \quad x \in \Omega_{2} . \tag{3.13}
\end{equation*}
$$

It follows from the jump conditions of the single- and double-layer potentials and (3.12) that the field $u_{1}$ satisfy the boundary integral equation

$$
\begin{align*}
& u_{1}(x)=2 \int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}+2 \int_{S}\left[\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{1}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} \\
& +2 u^{i}(x), \quad x \in \Gamma . \tag{3.14}
\end{align*}
$$

In (3.12) and (3.13), using the jump conditions of the single- and double-layer potentials and the continuity condition $\left.u_{1}\right|_{S}=\left.u_{2}\right|_{S}$ in (2.8), we get the boundary integral equation

$$
\begin{align*}
u_{1}(x)=\int_{S} & {\left[\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)}\right) u_{1}(y)-\left(G_{1}(x, y)-G_{2}(x, y)\right) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} } \\
& +\int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}+u^{i}(x), \quad x \in S . \tag{3.15}
\end{align*}
$$

Note that the boundary integral equations (3.14)-(3.15) involve the unknown $\frac{\partial u_{1}}{\partial \nu_{S}}$ on $S$. It requires to take the normal derivatives of (3.12) and (3.13) on $S$, which leads to boundary integral equations with hyper-singular kernels. We combine the normal derivatives of (3.12) and (3.13) to avoid this issue. Taking the normal derivatives of (3.12) and (3.13) on $S$ and adding them together, using the jump conditions of the single- and double-layer potentials, and noting the jump condition $\left.\frac{\partial u_{1}}{\partial \nu_{S}}\right|_{S}=$ $\left.\frac{\partial u_{2}}{\partial \nu_{S}}\right|_{S}$ in (2.8), we have the boundary integral equation

$$
\begin{align*}
\frac{\partial u_{1}(x)}{\partial \nu_{S}(x)}=\int_{S} & {\left[\left(\frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)}-\frac{\partial^{2} G_{2}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)}\right) u_{1}(y)-\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(x)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(x)}\right) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} } \\
& +\int_{\Gamma} \frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}+\frac{\partial u^{i}(x)}{\partial \nu_{S}(x)}, \quad x \in S \tag{3.16}
\end{align*}
$$

Theorem 3.2. Let $u^{s} \in \mathcal{T}_{1}, u_{2} \in \mathcal{T}_{2}$ have the integral representations (3.12)-(3.13) and satisfy the boundary integral equations (3.14)-(3.16). Then $\left(u_{1}, u_{2}\right)$ are the solutions of Problem 2.1.

Proof. We only show the proof for the field $u_{1}$. The corresponding result can be similarly proved for the field $u_{2}$. If the field $u^{s} \in \mathcal{T}_{1}$ has the integral representation (3.12), then we have

$$
\begin{equation*}
u^{s}(x)=\int_{S}\left[\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{1}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y}+\int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}, \quad x \in \Omega_{1} . \tag{3.17}
\end{equation*}
$$

Noting that for any $x \in \Omega_{1}$ and $y \in S \cup \Gamma$, we have $x \neq y$. Thus, from (2.1) and (3.17), we obtain that

$$
\begin{align*}
& \Delta u^{s}(x)+k_{1}^{2} u^{s}(x) \\
& =\int_{S}\left(u_{1}(y) \frac{\partial}{\partial \nu_{S}}\left(\Delta_{x} G_{1}(x, y)+k_{1}^{2} G_{1}(x, y)\right)-\frac{\partial u_{1}(y)}{\partial \nu_{S}}\left(\Delta_{x} G_{1}(x, y)+k_{1}^{2} G_{1}(x, y)\right)\right) \mathrm{d} s_{y} \\
& \quad+\int_{\Gamma} u_{1}(y) \frac{\partial}{\partial \nu_{\Gamma}}\left(\Delta_{x} G_{1}(x, y)+k_{1}^{2} G_{1}(x, y)\right) \mathrm{d} s_{y}=0, \quad x \in \Omega_{1} . \tag{3.18}
\end{align*}
$$

It follows from (2.4) and (3.18) that

$$
\begin{equation*}
\Delta u_{1}+k_{1}^{2} u_{1}=\left(\Delta u^{s}+k_{1}^{2} u^{s}\right)+\left(\Delta u^{i}+k_{1}^{2} u^{i}\right)=-\delta\left(x-x_{s}\right) \quad \text { in } \Omega_{1} . \tag{3.19}
\end{equation*}
$$

Furthermore, with the help of Lemma 2.2 and (3.17), we deduce that

$$
\left.\left.\begin{array}{rl}
\left|u^{s}(x)\right| \leq & C \\
& +\int_{S}\left|G_{1}(x, y)\right|\left|\frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right| \mathrm{d} s_{y}+\int_{S}\left|\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}\right|\left|u_{1}(y)\right| \mathrm{d} s_{y} \\
\leq & C \\
& {\left[\left.\| \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} \right\rvert\, \mathrm{d} s_{y}\right]} \\
\partial \nu_{S}
\end{array}\right|_{C^{0, \alpha}(S)} \int_{S}\left|G_{1}(x, y)\right| \mathrm{d} s_{y}+\left\|u_{1}\right\|_{C^{0, \alpha}(S)} \int_{S}\left|\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}\right| \mathrm{d} s_{y}, ~\left\|u_{1}\right\|_{C^{0, \alpha}(\Gamma)} \int_{\Gamma}\left|\frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)}\right| \mathrm{d} s_{y}\right] .
$$

For each fixed $r \geq 1$, as $|x| \rightarrow+\infty$, by Lemma 2.2, we have

$$
\begin{align*}
\int_{S_{r}}\left|G_{1}(x, y)\right| \mathrm{d} s_{y} & \leq C \int_{S_{r}}\left|\frac{\exp \left(\frac{1}{2} \mathrm{i} k_{1}|x-y|\right)}{|x-y|^{\frac{1}{2}}} \exp \left(\frac{1}{2} \mathrm{i} k_{1}|x-y|\right)\right| \mathrm{d} s_{y} \\
& \leq C \frac{\exp \left(-\frac{1}{4} \Im\left(k_{1}\right)|x|\right)}{|x|^{\frac{1}{2}}} \int_{0}^{r} \exp \left(-\frac{1}{2} \Im\left(k_{1}\right) y_{1}\right) \mathrm{d} y_{1} \\
& \leq C \frac{\exp \left(-\frac{1}{4} \Im\left(k_{1}\right)|x|\right)}{|x|^{\frac{1}{2}}}\left(1-\exp \left(-\frac{r}{2} \Im\left(k_{1}\right)\right)\right) . \tag{3.21}
\end{align*}
$$

Similarly, we may show that

$$
\begin{gather*}
\int_{S_{r}}\left|\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}\right| \mathrm{d} s_{y} \leq C \frac{\exp \left(-\frac{1}{4} \Im\left(k_{1}\right)|x|\right)}{|x|^{\frac{1}{2}}}\left(1-\exp \left(-\frac{r}{2} \Im\left(k_{1}\right)\right)\right),  \tag{3.22}\\
\int_{\Gamma}\left|\frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)}\right| \mathrm{d} s_{y} \leq C \frac{\exp \left(-\frac{1}{2} \Im\left(k_{1}\right)|x|\right)}{|x|^{\frac{1}{2}}} \tag{3.23}
\end{gather*}
$$

Combining (3.20)-(3.23) and noting $\Im\left(k_{1}\right)>0$, we obtain

$$
\left|u^{s}(x)\right| \leq C\left(\frac{\exp \left(-\frac{1}{4} \Im\left(k_{1}\right)|x|\right)}{|x|^{\frac{1}{2}}}\right), \quad|x| \rightarrow+\infty
$$

and

$$
\begin{aligned}
\int_{\partial B_{r}^{+}}\left|u^{s}\right|^{2} \mathrm{~d} s_{x} & \leq C \int_{\partial B_{r}^{+}} \frac{\exp \left(-\frac{1}{2} \Im\left(k_{1}\right)|x|\right)}{|x|} \mathrm{d} s_{x} \\
& \leq C\left(\frac{\exp \left(-\frac{1}{2} \Im\left(k_{1}\right) r\right)}{r} 2 \pi r\right) \leq C \exp \left(-\frac{1}{2} \Im\left(k_{1}\right) r\right) \rightarrow 0, \quad r \rightarrow+\infty
\end{aligned}
$$

where $C$ is a positive constant independent of $r$.
Similarly, we can show that

$$
\lim _{r \rightarrow+\infty} \int_{\partial B_{r}^{+}}\left|\frac{\partial u^{s}(x)}{\partial \nu(x)}\right|^{2} \mathrm{~d} s_{x}=\lim _{r \rightarrow+\infty} \int_{\partial B_{r}^{-}}\left|u_{2}\right|^{2} \mathrm{~d} s_{x}=\lim _{r \rightarrow+\infty} \int_{\partial B_{r}^{-}}\left|\frac{\partial u_{2}(x)}{\partial \nu(x)}\right|^{2} \mathrm{~d} s_{x}=0
$$

Since $u_{1}$ satisfies (3.19) and the above radiation condition, applying the Green second theorem to $u_{1}$ and $G_{1}$ in the region $\Omega_{1}$, using the jump conditions of the single- and double-layer potentials, we obtain the boundary integral equation

$$
\begin{align*}
u_{1}(x)= & 2 \int_{S}\left[\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{1}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} \\
& +2 \int_{\Gamma}\left[\frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y)-G_{1}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{\Gamma}(y)}\right] \mathrm{d} s_{y}+2 u^{i}(x), \quad x \in \Gamma . \tag{3.24}
\end{align*}
$$

From (3.14) and (3.24), it is easy to verify that $\left.\frac{\partial u_{1}}{\partial \nu_{\Gamma}}\right|_{\Gamma}=0$.
In (3.12) and (3.13), using the jump conditions of the single- and double-layer potentials, we get the boundary integral equations

$$
\begin{array}{r}
\frac{1}{2} u_{1}(x)=u^{i}(x)+\int_{S}\left[\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{1}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} \\
+\int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}, \quad x \in S \tag{3.25}
\end{array}
$$

and

$$
\begin{equation*}
u_{2}(x)-\frac{1}{2} u_{1}(x)=-\int_{S}\left[\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)} u_{1}(y)-G_{2}(x, y) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y}, \quad x \in S . \tag{3.26}
\end{equation*}
$$

Now adding (3.25) and (3.26) gives

$$
\begin{align*}
u_{2}(x)=\int_{S} & {\left[\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(y)}\right) u_{1}(y)-\left(G_{1}(x, y)-G_{2}(x, y)\right) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} } \\
& +\int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}+u^{i}(x), \quad x \in S . \tag{3.27}
\end{align*}
$$

From (3.15) and (3.27), it is easy to verify that $\left.u_{1}\right|_{S}=\left.u_{2}\right|_{S}$.
Taking the normal derivatives of (3.12) and (3.13) on $S$, using the jump conditions of the singleand double-layer potentials, we get the boundary integral equations

$$
\begin{array}{r}
\frac{1}{2} \frac{\partial u_{1}(x)}{\partial \nu_{S}(x)}=\frac{\partial u^{i}(x)}{\partial \nu_{S}(x)}+\int_{S}\left[\frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)} u_{1}(y)-\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(x)} \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} \\
+\int_{\Gamma} \frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}, \quad x \in S \tag{3.28}
\end{array}
$$

and

$$
\begin{equation*}
\frac{\partial u_{2}(x)}{\partial \nu_{S}(x)}-\frac{1}{2} \frac{\partial u_{1}(x)}{\partial \nu_{S}(x)}=-\int_{S}\left[\frac{\partial^{2} G_{2}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)} u_{1}(y)-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(x)} \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y}, \quad x \in S . \tag{3.29}
\end{equation*}
$$

Adding them together, we have the boundary integral equation

$$
\begin{align*}
\frac{\partial u_{2}(x)}{\partial \nu_{S}(x)}=\int_{S} & {\left[\left(\frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)}-\frac{\partial^{2} G_{2}(x, y)}{\partial \nu_{S}(x) \partial \nu_{S}(y)}\right) u_{1}(y)-\left(\frac{\partial G_{1}(x, y)}{\partial \nu_{S}(x)}-\frac{\partial G_{2}(x, y)}{\partial \nu_{S}(x)}\right) \frac{\partial u_{1}(y)}{\partial \nu_{S}(y)}\right] \mathrm{d} s_{y} } \\
& +\int_{\Gamma} \frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{\Gamma}(y)} u_{1}(y) \mathrm{d} s_{y}+\frac{\partial u^{i}(x)}{\partial \nu_{S}(x)}, \quad x \in S . \tag{3.30}
\end{align*}
$$

From (3.16) and (3.30), it is easy to verify that $\left.\frac{\partial u_{1}}{\partial \nu_{S}}\right|_{S}=\left.\frac{\partial u_{2}}{\partial \nu_{S}}\right|_{S}$.
The system of boundary integral equations (3.14)-(3.16) can be written in the operator form

$$
\left[\begin{array}{ccc}
\mathbf{I}-\mathbf{K}_{\Gamma} & -\mathbf{K}_{S, \Gamma} & \mathbf{S}_{S, \Gamma}  \tag{3.31}\\
-\mathbf{K}_{\Gamma, S} & \mathbf{I}-\mathbf{K}_{S} & \mathbf{S}_{S} \\
-\mathbf{T}_{\Gamma, S} & -\mathbf{T}_{S} & \mathbf{I}+\mathbf{K}_{S}^{*}
\end{array}\right]\left[\begin{array}{c}
\left.u_{1}\right|_{\Gamma} \\
\left.u_{1}\right|_{S} \\
\left.\frac{\partial u_{1}}{\partial \nu_{S}}\right|_{S}
\end{array}\right]=\left[\begin{array}{c}
\left.2 u^{i}\right|_{\Gamma} \\
\left.u^{i}\right|_{S} \\
\left.\frac{\partial u^{S}}{\partial \nu_{S}}\right|_{S}
\end{array}\right],
$$

where $\mathbf{I}$ is the identity operator and the potential operators

$$
\left(\mathbf{S}_{S, \Gamma} \phi\right)(x)=2 \int_{S} G_{1}(x, y) \phi(y) \mathrm{d} s_{y}, \quad\left(\mathbf{K}_{S, \Gamma} \phi\right)(x)=2 \int_{S} \frac{\partial G_{1}(x, y)}{\partial \nu_{S}(y)} \phi(y) \mathrm{d} s_{y}, \quad x \in \Gamma,
$$

and

$$
\left(\mathbf{K}_{\Gamma, S} \phi\right)(x)=\int_{\Gamma} \frac{\partial G_{1}(x, y)}{\partial \nu_{\Gamma}(y)} \phi(y) \mathrm{d} s_{y}, \quad\left(\mathbf{T}_{\Gamma, S} \phi\right)(x)=\int_{\Gamma} \frac{\partial^{2} G_{1}(x, y)}{\partial \nu_{S}(x) \partial \nu_{\Gamma}(y)} \phi(y) \mathrm{d} s_{y}, \quad x \in S,
$$

have continuous kernels, which decay exponentially. It follows from [14, Theorem 1.10] that these operators are compact.
3.4. Solvability. Since the kernels of the operators $\mathbf{K}_{\Gamma}, \mathbf{K}_{\Gamma}^{*}, \mathbf{S}_{A}, \mathbf{K}_{A}, \mathbf{K}_{A}^{*}$ and $\mathbf{T}_{A}$ are weakly singular and decay exponentially, it follows from [14, Theorem 1.11] and [14, Theorem 2.7] that these integral operators are compact. Based on the compactness of the truncated operators, the integral operators $\mathbf{S}_{S}, \mathbf{K}_{S}, \mathbf{K}_{S}^{*}$ and $\mathbf{T}_{S}$ are compact as described in the following theorem.

Lemma 3.3. The integral operators $\mathbf{S}_{S}, \mathbf{K}_{S}, \mathbf{K}_{S}^{*}$ and $\mathbf{T}_{S}$ are compact.
Proof. Since the proofs are similar for $\mathbf{S}_{S}, \mathbf{K}_{S}, \mathbf{K}_{S}^{*}$ and $\mathbf{T}_{S}$, we shall only show the details for the operator $\mathbf{S}_{S}$. For each fixed $x \in S$, we have

$$
\begin{align*}
\left(\mathbf{S}_{S} \phi_{2}\right)(x)-\left(\mathbf{S}_{A} \phi_{2}\right)(x) & =\int_{S \backslash S_{A}}\left(G_{1}(x, y)-G_{2}(x, y)\right) \phi_{2}(y) \mathrm{d} s_{y} \\
& =\left(\int_{A}^{+\infty}+\int_{-\infty}^{-A}\right) \Psi\left(x, y_{1}\right) \mathrm{d} y_{1}:=I_{1}+I_{2} \tag{3.32}
\end{align*}
$$

where

$$
\Psi\left(x, y_{1}\right)=\left[\left.\left(G_{1}(x, y)-G_{2}(x, y)\right) \phi_{2}(y)\right|_{y_{2}=f\left(y_{1}\right)}\right]\left(1+f_{y_{1}}^{2}\right)^{1 / 2} .
$$

By Lemma 2.2, for each fixed $x \in S$, when $A \rightarrow+\infty$, we have $\left|x_{1}-A\right| \rightarrow+\infty$ and

$$
\begin{align*}
\left|I_{1}\right| & \leq \int_{A}^{+\infty}\left|\Psi\left(x, y_{1}\right)\right| \mathrm{d} y_{1} \leq C \int_{A}^{+\infty}\left|\left(G_{1}(x, y)-G_{2}(x, y)\right) \phi_{2}(y)\right|_{y_{2}=f\left(y_{1}\right)} \mathrm{d} y_{1} \\
& \leq C \sup _{y \in S}\left|\phi_{2}(y)\right| \int_{A}^{+\infty}\left|G_{1}(x, y)-G_{2}(x, y)\right|_{y_{2}=f\left(y_{1}\right)} \mathrm{d} y_{1} \\
& \leq C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)} \int_{A}^{+\infty}\left(\left.\frac{\exp \left(-\frac{1}{2} \Im\left(k_{1}\right)|y|\right)}{|y|^{\frac{1}{2}}}\right|_{y_{2}=f\left(y_{1}\right)}+\left.\frac{\exp \left(-\frac{1}{2} \Im\left(k_{2}\right)|y|\right)}{|y|^{\frac{1}{2}}}\right|_{y_{2}=f\left(y_{1}\right)}\right) \mathrm{d} y_{1} \\
& \leq C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)} \int_{A}^{+\infty}\left(\frac{\exp \left(-\frac{1}{2} \hat{k}\left|y_{1}\right|\right)}{\left|y_{1}\right|^{\frac{1}{2}}}\right) \mathrm{d} y_{1} \\
& \leq C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}}\right) \int_{A}^{+\infty} \exp \left(-\frac{1}{2} \hat{k} y_{1}\right) \mathrm{d} y_{1} \\
& =C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{2}{\hat{k}}\right)\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty \tag{3.33}
\end{align*}
$$

where $C>0$ is a constant but may change from step by step, $\hat{k}=\min \left\{\Im\left(k_{1}\right), \Im\left(k_{2}\right)\right\}>0$. Similarly, we may also show that

$$
\begin{equation*}
\left|I_{2}\right| \leq C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty . \tag{3.34}
\end{equation*}
$$

Combining (3.32)-(3.34), we obtain

$$
\begin{aligned}
\left|\left(\mathbf{S}_{S} \phi_{2}\right)(x)-\left(\mathbf{S}_{A} \phi_{2}\right)(x)\right| & \leq\left|I_{1}\right|+\left|I_{2}\right| \\
& \leq C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty
\end{aligned}
$$

which implies that

$$
\begin{equation*}
\left\|\mathbf{S}_{S}-\mathbf{S}_{A}\right\|_{\infty}=\frac{\sup _{x \in S}\left|\left(\mathbf{S}_{S} \phi_{2}\right)(x)-\left(\mathbf{S}_{A} \phi_{2}\right)(x)\right|}{\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}} \leq C\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty \tag{3.35}
\end{equation*}
$$

Note that

$$
\begin{aligned}
{\left[\nabla_{x}\left(\mathbf{S}_{S} \phi_{2}\right)(x)\right]-\left[\nabla_{x}\left(\mathbf{S}_{A} \phi_{2}\right)(x)\right] } & =\int_{S \backslash S_{A}}\left(\nabla_{x} G_{1}(x, y)-\nabla_{x} G_{2}(x, y)\right) \phi_{2}(y) \mathrm{d} s_{y} \\
& =\left(\int_{A}^{+\infty}+\int_{-\infty}^{-A}\right) \nabla_{x} \Psi\left(x, y_{1}\right) \mathrm{d} y_{1}
\end{aligned}
$$

where

$$
\nabla_{x} \Psi\left(x, y_{1}\right)=\left[\left.\left(\nabla_{x} G_{1}(x, y)-\nabla_{x} G_{2}(x, y)\right) \phi_{2}(y)\right|_{y_{2}=f\left(y_{1}\right)}\right]\left(1+f_{y_{1}}^{2}\right)^{1 / 2}
$$

For each fixed $x \in S$, using Lemma 2.2 and repeating a proof similar to (3.33) and (3.34), we obtain

$$
\left|\left[\nabla_{x}\left(\mathbf{S}_{S} \phi_{2}\right)(x)\right]-\left[\nabla_{x}\left(\mathbf{S}_{A} \phi_{2}\right)(x)\right]\right| \leq C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty
$$

which implies that

$$
\begin{align*}
\left\|\nabla_{x} \mathbf{S}_{S}-\nabla_{x} \mathbf{S}_{A}\right\|_{\infty} & =\frac{\sup _{x \in S}\left|\left[\nabla_{x}\left(\mathbf{S}_{S} \phi_{2}\right)(x)\right]-\left[\nabla_{x}\left(\mathbf{S}_{A} \phi_{2}\right)(x)\right]\right|}{\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}} \\
& \leq C\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty . \tag{3.36}
\end{align*}
$$

For each fixed $x, \tilde{x} \in S$ and $x \neq \tilde{x}$, we have

$$
\begin{align*}
& \nabla_{x}\left(\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right)(x)-\nabla_{\tilde{x}}\left(\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right)(\tilde{x}) \\
& =\left(\int_{A}^{+\infty}+\int_{-\infty}^{-A}\right)\left[\nabla_{x} \Psi\left(x, y_{1}\right)-\nabla_{\tilde{x}} \Psi\left(\tilde{x}, y_{1}\right)\right] \mathrm{d} y_{1}:=I_{3}+I_{4} . \tag{3.37}
\end{align*}
$$

From the mean value theorem and Lemma 2.2, when $A \rightarrow+\infty$, we have $\left|x_{1}-A\right| \rightarrow+\infty,\left|\tilde{x}_{1}-A\right| \rightarrow$ $+\infty$ and

$$
\left|\nabla_{x} G_{j}(x, y)-\nabla_{\tilde{x}} G_{j}(\tilde{x}, y)\right| \leq C \frac{\exp \left(-\frac{1}{2} \Im\left(k_{j}\right)|y|\right)}{|y|^{\frac{1}{2}}}|x-\tilde{x}|, \quad A \rightarrow+\infty, j=1,2 .
$$

Hence,

$$
\begin{align*}
\left|I_{3}\right| & \leq \int_{A}^{+\infty}\left|\nabla_{x} \Psi\left(x, y_{1}\right)-\nabla_{\tilde{x}} \Psi\left(\tilde{x}, y_{1}\right)\right| \mathrm{d} y_{1} \\
& \leq C \int_{A}^{+\infty}\left[\left(\left|\nabla_{x} G_{1}(x, y)-\nabla_{\tilde{x}} G_{1}(\tilde{x}, y)\right|+\left|\nabla_{x} G_{2}(x, y)-\nabla_{\tilde{x}} G_{2}(\tilde{x}, y)\right|\right)\left|\phi_{2}(y)\right|\right]_{y_{2}=f\left(y_{1}\right)} \mathrm{d} y_{1} \\
& \leq C(|x-\tilde{x}|) \sup _{y \in S}\left|\phi_{2}(y)\right| \int_{A}^{+\infty}\left(\left.\frac{\exp \left(-\frac{1}{2} \Im\left(k_{1}\right)|y|\right)}{|y|^{\frac{1}{2}}}\right|_{y_{2}=f\left(y_{1}\right)}+\left.\frac{\exp \left(-\frac{1}{2} \Im\left(k_{2}\right)|y|\right)}{|y|^{\frac{1}{2}}}\right|_{y_{2}=f\left(y_{1}\right)}\right) \mathrm{d} y_{1} \\
& \leq C(|x-\tilde{x}|)\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{2}{\hat{k}}\right)\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) . \tag{3.38}
\end{align*}
$$

Similarly, we have

$$
\begin{equation*}
\left|I_{4}\right| \leq C(|x-\tilde{x}|)\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) . \tag{3.39}
\end{equation*}
$$

Using (3.37)-(3.39), we obtain for $0<\alpha<1$ that

$$
\begin{align*}
& \frac{\left|\nabla_{x}\left(\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right)(x)-\nabla_{x}\left(\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right)(\tilde{x})\right|}{|x-\tilde{x}|^{\alpha}} \\
& \leq\left(\left|I_{3}\right|+\left|I_{4}\right|\right)|x-\tilde{x}|^{-\alpha} \leq C\left(|x-\tilde{x}|^{1-\alpha}\right)\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \\
& \leq C A^{1-\alpha}\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(\frac{1}{\sqrt{A}} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \\
& =C\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}\left(A^{\frac{1}{2}-\alpha} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty . \tag{3.40}
\end{align*}
$$

For $0<\alpha<1$, by (3.35), (3.36) and (3.40), it can be deduced that

$$
\begin{aligned}
& \left\|\mathbf{S}_{S}-\mathbf{S}_{A}\right\|_{C^{1, \alpha}(S)} \\
& =\sup _{\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)} \neq 0} \frac{\left\|\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right\|_{C^{1, \alpha}(S)}}{\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}} \\
& =\sup _{\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)} \neq 0} \frac{1}{\left\|\phi_{2}\right\|_{C^{0, \alpha}(S)}}\left[\left\|\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right\|_{\infty}+\left\|\nabla_{x}\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right\|_{\infty}\right. \\
& \left.\quad+\sup _{\substack{x, \tilde{x} \in S \\
x \neq \tilde{x}}} \frac{\left|\nabla_{x}\left(\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right)(x)-\nabla_{x}\left(\left(\mathbf{S}_{S}-\mathbf{S}_{A}\right) \phi_{2}\right)(\tilde{x})\right|}{|x-\tilde{x}|^{\alpha}}\right] \\
& \leq C\left(\sqrt{A} \exp \left(-\frac{A}{2} \hat{k}\right)\right) \rightarrow 0, \quad A \rightarrow+\infty
\end{aligned}
$$

which shows that the operator $\mathbf{S}_{S}$ is compact on $C^{0, \alpha}(S)$.
By Lemma 3.3, the system (3.31) is Fredholm, which implies that the existence of a solution to (3.31) follows from the uniqueness of the solution. Although the direct scattering problem is shown to have a unique solution in Theorem 3.1, the boundary integral equations (3.31) may not have a unique solution due to the possible existence of resonance. This issue can be overcome by using the combined single- and double-layer potentials. We will not elaborate on this issue and leave it along with the numerical solution of (3.31) for a future work.

## 4. Uniqueness of the inverse scattering problem

This section addresses the global uniqueness of the inverse scattering problem. Given the incident field which satisfies (2.3), we show that the obstacle and the infinite rough surface can be uniquely determined by the wave field $\left.u_{j}\right|_{\Gamma_{j}}, j=1,2$.

Let $\widetilde{S} \in C^{2}$ be an infinite rough surface which divides $\mathbb{R}^{n}$ into the upper half space $\widetilde{\Omega}_{1}^{+}$and the lower half space $\widetilde{\Omega}_{2}$. Let $\widetilde{D} \subset \subset \widetilde{\Omega}_{1}^{+}$be a bounded obstacle with the boundary $\widetilde{\Gamma} \in C^{2}$. Define $\widetilde{\Omega}_{1}=\widetilde{\Omega}_{1}^{+} \backslash \widetilde{D}$. Let $\left(\tilde{u}_{1}, \tilde{u}_{2}\right)$ be the unique solutions of Problem 2.1 with $D$ replaced by $\widetilde{D}$ and $S$ replaced by $\widetilde{S}$ but for the same incident field $u^{i}$ satisfying (2.3), where $\tilde{u}_{1}$ satisfies the sound hard boundary condition

$$
\frac{\partial \tilde{u}_{1}}{\partial \nu_{\widetilde{\Gamma}}}=0 \quad \text { on } \widetilde{\Gamma},
$$

and the continuity conditions

$$
\tilde{u}_{1}=\tilde{u}_{2}, \quad \frac{\partial \tilde{u}_{1}}{\partial \nu_{\widetilde{S}}}=\frac{\partial \tilde{u}_{2}}{\partial \nu_{\widetilde{S}}} \quad \text { on } \widetilde{S},
$$

where $\nu_{\widetilde{\Gamma}}$ be the unit normal vector on $\widetilde{\Gamma}$ directed into the exterior of $\widetilde{D}$ and let $\nu_{\widetilde{S}}$ be the unit normal vector on the boundary $\widetilde{S}$ pointing from region $\widetilde{\Omega}_{2}$ to region $\widetilde{\Omega}_{1}$. Since the point source is assumed to be located in $R_{1}^{+}$, we have $x_{s} \in \Omega_{1} \cap \widetilde{\Omega}_{1}$. In addition, $\tilde{u}_{1}$ satisfies the transparent boundary condition (2.9).

Lemma 4.1. Let $\Omega \subset \mathbb{R}^{2}$ be a bounded Lipschitz domain. Consider the boundary value problem

$$
\begin{cases}\Delta u+k_{1}^{2} u=0, \quad \Delta v+k_{2}^{2} v=0 & \text { in } \Omega,  \tag{4.1}\\ u=v, \quad \frac{\partial u}{\partial \nu}=\frac{\partial v}{\partial \nu} & \text { on } \partial \Omega\end{cases}
$$

where $\nu$ is the unit normal vector on $\Omega$. Then $u=v=0$ in $\Omega$.
Proof. Consider an extension $\breve{v}$ of $v$ to the exterior domain $\Omega^{e}=\mathbb{R}^{2} \backslash \bar{\Omega}$, where $\breve{v}$ satisfies

$$
\begin{cases}\Delta \breve{v}+k_{2}^{2} \stackrel{\rightharpoonup}{v}=0 & \text { in } \Omega^{e} \\ \breve{v}=v, \quad \frac{\partial \breve{v}}{\partial \nu}=\frac{\partial v}{\partial \nu} & \text { on } \partial \Omega\end{cases}
$$

and the radiation condition

$$
\lim _{r \rightarrow \infty} \int_{\partial B_{r}}\left(|\breve{v}|^{2}+\left|\frac{\partial \breve{v}}{\partial \nu}\right|^{2}\right) \mathrm{d} s=0 .
$$

Multiplying the equation $\Delta u+k_{1}^{2} u=0$ by the complex conjugate of $u$, integrating over $\Omega$, and using the integration by parts, we have

$$
\int_{\Omega}|\nabla u|^{2} \mathrm{~d} x-k_{1}^{2} \int_{\Omega}|u|^{2} \mathrm{~d} x=\int_{\partial \Omega} \frac{\partial u}{\partial \nu} \bar{u} \mathrm{~d} s .
$$

On the other hand, multiplying the equation $\Delta \breve{v}+k_{2}^{2} \breve{v}=0$ by the complex conjugate of $\breve{v}$, integrating over $\Omega^{e}$, using the integration by parts and the radiation condition, we obtain

$$
\int_{\Omega^{e}}|\nabla \breve{v}|^{2} \mathrm{~d} x-k_{2}^{2} \int_{\Omega^{e}}|\breve{v}|^{2} \mathrm{~d} x=-\int_{\partial \Omega} \frac{\partial \breve{v}}{\partial \nu} \breve{v} \mathrm{~d} s
$$

Since $u=v=\breve{v}$ and $\frac{\partial u}{\partial \nu}=\frac{\partial v}{\partial \nu}=\frac{\partial \breve{v}}{\partial \nu}$ on $\partial \Omega$, we add the above two equation and get

$$
\int_{\Omega}|\nabla u|^{2} \mathrm{~d} x+\int_{\Omega^{e}}|\nabla \breve{v}|^{2} \mathrm{~d} x-k_{1}^{2} \int_{\Omega}|u|^{2} \mathrm{~d} x-k_{2}^{2} \int_{\Omega^{e}}|\breve{v}|^{2} \mathrm{~d} x=0
$$

Noting $\Im k_{j}^{2}>0$ and taking the imaging part of the above equation yields that $u=0$ in $\Omega$ and $\breve{v}=0$ in $\Omega^{e}$, which implies immediately that $u=v=0$ in $\Omega$.

Remark 4.2. The result still holds for $k_{1}=k_{2}$ in Lemma 4.1. In this case, the problem (4.1) is equivalent to the following scattering problem: To find $u$ such that it satisfies the Helmholtz equation

$$
\Delta u+k_{1}^{2} u=0 \quad \text { in } \mathbb{R}^{2}
$$

and the radiation condition

$$
\lim _{r \rightarrow \infty} \int_{\partial B_{r}}\left(|u|^{2}+\left|\frac{\partial u}{\partial \nu}\right|^{2}\right) \mathrm{d} s=0
$$

It is clear to note that the above scattering problem has a unique solution $u=0$ in $\mathbb{R}^{2}$ due to $\Im k_{1}^{2}>0$.
Lemma 4.3. Let $u_{1}$ be the solution of Problem 2.1. Then $u_{1} \neq 0$ on $\Gamma$ or $S$.

Proof. We prove it by contradiction. First we assume that $u_{1}=0$ on $\Gamma$. Recall the sound hard boundary condition $\frac{\partial u_{1}}{\partial \nu_{\Gamma}}=0$ on $\Gamma$. Consider an extension $\breve{u}_{1}$ of $u_{1}$ to the domain $\Omega_{1}^{+}$:

$$
\breve{u}_{1}:= \begin{cases}u_{1} & \text { in } \Omega_{1}, \\ v_{1} & \text { in } D,\end{cases}
$$

where $v_{1}$ satisfies

$$
\begin{cases}\Delta v_{1}+k_{1}^{2} v_{1}=0 & \text { in } D,  \tag{4.2}\\ v_{1}=u_{1}, \quad \frac{\partial v_{1}}{\partial \nu_{\Gamma}}=\frac{\partial u_{1}}{\partial \nu_{\Gamma}} & \text { on } \Gamma .\end{cases}
$$

Hence the extension $\breve{u}_{1}$ satisfies

$$
\begin{cases}\Delta \breve{u}_{1}+k_{1}^{2} \breve{u}_{1}=0 & \text { in } R_{1},  \tag{4.3}\\ \frac{\partial \breve{u}_{1}}{\partial \nu_{\Gamma_{1}}}=T_{1} \breve{u}_{1}+\rho_{1} & \text { on } \Gamma_{1} .\end{cases}
$$

Since $\breve{u}_{1}=u_{1}=0$ on $\Gamma$ and $\Im k_{1}^{2}>0$, it is easy to verify from (4.2) that $\breve{u}_{1}=v_{1}=0$ in $D$. It follows from the unique continuation that $\breve{u}_{1}=0$ in $R_{1}$, which contradicts the transparent boundary condition in (4.3).

Next we assume that $u_{1}=0$ on $S$. Since $u_{2}=u_{1}=0$ on $S$, we may consider the following problem

$$
\begin{cases}\Delta u_{2}+k_{2}^{2} u_{2}=0 & \text { in } \Omega_{2},  \tag{4.4}\\ u_{2}=0 & \text { on } S .\end{cases}
$$

In addition, $u_{2}$ is required to satisfy the radiation condition (2.10). Multiplying the complex conjugate of $u_{2}$, integrating over $\Omega_{2}$, and using the radiation condition, we obtain

$$
\int_{\Omega_{2}}\left|\nabla u_{2}\right|^{2} \mathrm{~d} x-k_{2}^{2} \int_{\Omega_{2}}\left|u_{2}\right|^{2} \mathrm{~d} x=0
$$

which implies $u_{2}=0$ in $\Omega_{2}$ due to $\Im k_{2}^{2}>0$. Hence $\frac{\partial u_{2}}{\partial \nu_{S}}=0$ on $S$. Since $u_{1}=u_{2}=0$ and $\frac{\partial u_{1}}{\partial \nu_{S}}=\frac{\partial u_{2}}{\partial \nu_{S}}=0$ on $S$, by the Holmgren uniqueness theorem, $u_{1}=0$ in $R_{1}$. In fact, $u_{1}$ can be extended to $\Omega_{1} \cup \Omega_{2}$ as follows

$$
\breve{u}_{1}:= \begin{cases}u_{1} & \text { in } \Omega_{1}, \\ v_{1} & \text { in } \Omega_{2},\end{cases}
$$

where $v_{1}$ satisfies

$$
\begin{cases}\Delta v_{1}+k_{1}^{2} v_{1}=0 & \text { in } \Omega_{2},  \tag{4.5}\\ v_{1}=u_{1}, \quad \frac{\partial v_{1}}{\partial \nu_{S}}=\frac{\partial u_{1}}{\partial \nu_{S}} & \text { on } S\end{cases}
$$

and the radiation condition (2.10). Clearly the problem (4.5) has a unique solution $v_{1}=0$ in $\Omega_{2}$. By the unique continuation, we have $u_{1}=\breve{u}_{1}=0$ in $R_{1}$, which contradicts the transparent boundary condition (2.9).

Theorem 4.4. Assume that $u_{j}\left|\Gamma_{j}=\tilde{u}_{j}\right|_{\Gamma_{j}}, j=1,2$ for the given the incident wave $u^{i}$. Then $D=\widetilde{D}$ and $S=\widetilde{S}$.

Proof. Let $v_{j}=u_{j}-\tilde{u}_{j}$, then $v_{j}$ satisfies the Helmholtz equation

$$
\Delta v_{j}+k_{j}^{2} v_{j}=0 \quad \text { in } \Omega_{j} \cap \widetilde{\Omega}_{j}
$$

and the radiation condition. By the assumption $\left.v_{j}\right|_{\Gamma_{j}}=\left.u_{j}\right|_{\Gamma_{j}}-\left.\tilde{u}_{j}\right|_{\Gamma_{j}}$ and the uniqueness result for the scattering problem, one can obtain that $v_{j}=u_{j}-\tilde{u}_{j}=0$ and $\nabla v_{j}=\nabla u_{j}-\nabla \tilde{u}_{j}=$ $0, j=1,2$ in $R_{1}^{+}=\left\{x \in \mathbb{R}^{2}: x_{n}>h_{1}\right\}$ and $R_{2}^{+}=\left\{x \in \mathbb{R}^{2}: x_{n}<h_{2}\right\}$, respectively. Since $v_{j} \in C^{2}\left(\Omega_{j} \cap \widetilde{\Omega}_{j}\right) \cap C^{1, \alpha}\left(\overline{\Omega_{j} \cap \widetilde{\Omega}_{j}}\right)$, by the unique continuation, we get that

$$
\begin{equation*}
v_{j}(x)=u_{j}(x)-\tilde{u}_{j}(x)=0, \quad x \in \overline{\Omega_{j} \cap \widetilde{\Omega}_{j}} \tag{4.6}
\end{equation*}
$$

Figure 2. Schematic of domains for the proof of uniqueness.
and

$$
\begin{equation*}
\frac{\partial v_{j}(x)}{\partial \nu}=\frac{\partial u_{j}(x)}{\partial \nu}-\frac{\partial \tilde{u}_{j}(x)}{\partial \nu}=0, \quad x \in \partial\left(\overline{\Omega_{j} \cap \widetilde{\Omega}_{j}}\right) . \tag{4.7}
\end{equation*}
$$

First, we show the obstacle can be uniquely determined by the total field $u_{1}$ on $\Gamma_{1}$. Assume that
 in Figure 2. Without loss of generality, we assume that $\widetilde{D} \backslash(\overline{D \cap \widetilde{D}}) \neq \emptyset$. Denote $\partial(\widetilde{D} \backslash(\overline{D \cap \widetilde{D}}))$ by $\widetilde{C} \cup C$, where $\widetilde{C} \subset \widetilde{\Gamma}$ and $C \subset \Gamma$. Since $\frac{\partial \tilde{u}_{1}}{\partial \nu_{\widetilde{\Gamma}}}=0$ on $\widetilde{\Gamma}$, we have from (4.6)-(4.7) that $\frac{\partial u_{1}}{\partial \nu_{\Gamma}}=0$ on $\widetilde{C}$. Recalling $\frac{\partial u_{1}}{\partial \nu_{\Gamma}}=0$ on $C$, we consider the following boundary value problem

$$
\begin{cases}\Delta u_{1}+k_{1}^{2} u_{1}=0 & \text { in } \widetilde{D} \backslash(\overline{D \cap \widetilde{D}}), \\ \frac{\partial u_{1}}{\partial \nu_{\widetilde{\Gamma}}}=0 & \text { on } \widetilde{C}, \\ \frac{\partial u_{1}}{\partial \nu_{\Gamma}}=0 & \text { on } C .\end{cases}
$$

Multiplying $\Delta u_{1}+k_{1}^{2} u_{1}=0$ by the complex conjugate of $u_{1}$, integrating over $\widetilde{D} \backslash(\overline{D \cap \widetilde{D}})$, using the integration by parts and the boundary conditions, we obtain

$$
\int_{\tilde{D} \backslash(\overline{D \cap \tilde{D}})}\left|\nabla u_{1}\right|^{2} \mathrm{~d} x-k_{1}^{2} \int_{\tilde{D} \backslash(\overline{D \cap \tilde{D})}}\left|u_{1}\right|^{2} \mathrm{~d} x=0,
$$

which implies that $u_{1}=0$ in $\widetilde{D} \backslash(\overline{D \cap \widetilde{D}})$ since $\Im k_{1}^{2}>0$. An application of the unique continuation gives $u_{1}=0$ in $R_{1}$. But this contradicts the transparent boundary condition (2.9) on $\Gamma_{1}$ since $\rho$ is a nonzero function involving the incident wave. Hence $D=\widetilde{D}$.

Next is show that the infinite rough surface $S$ can be uniquely determined by the wave fields $u_{1}$ and $u_{2}$ measured on $\Gamma_{1}$ and $\Gamma_{2}$, respectively. Assume that $S \neq \widetilde{S}$, where $\widetilde{S}=\left\{x \in \mathbb{R}^{2}: x_{2}=\tilde{f}\left(x_{1}\right)\right\}$ with $\tilde{f} \neq f$. Without loss of generality, we assume that there exist two points $x_{1}^{-}, x_{1}^{+}$satisfying $x_{1}^{-}<x_{1}^{+}$such that $f\left(x_{1}^{-}\right)=\tilde{f}\left(x_{1}^{-}\right), f\left(x_{1}^{+}\right)=\tilde{f}\left(x_{1}^{+}\right)$and $f\left(x_{1}\right)>\tilde{f}\left(x_{1}\right)$ for $x_{1} \in\left(x_{1}^{-}, x_{1}^{+}\right)$. Define $\Omega=\left\{x \in \mathbb{R}^{2}: \tilde{f}\left(x_{1}\right)<x_{2}<f\left(x_{1}\right), x_{1}^{-}<x_{1}<x_{1}^{+}\right\}$. The schematic of the domain $\Omega$ is also shown in Figure 2. Let $\partial \Omega=\Sigma \cup \widetilde{\Sigma}$, where $\Sigma \subset S$ and $\widetilde{\Sigma} \subset \widetilde{S}$. By (4.6)-(4.7), we have

$$
u_{1}=\tilde{u}_{1}, \quad \frac{\partial u_{1}}{\partial \nu}=\frac{\partial \tilde{u}_{1}}{\partial \nu} \quad \text { on } \Sigma
$$

and

$$
u_{2}=\tilde{u}_{2}, \quad \frac{\partial u_{2}}{\partial \nu}=\frac{\partial \tilde{u}_{2}}{\partial \nu} \quad \text { on } \widetilde{\Sigma} .
$$

It follows from the continuity conditions

$$
u_{1}=u_{2}, \quad \frac{\partial u_{1}}{\partial \nu}=\frac{\partial u_{2}}{\partial \nu} \quad \text { on } \Sigma
$$

and

$$
\tilde{u}_{1}=\tilde{u}_{2}, \quad \frac{\partial \tilde{u}_{1}}{\partial \nu}=\frac{\partial \tilde{u}_{2}}{\partial \nu} \quad \text { on } \widetilde{\Sigma} .
$$

Combining the above equations yields that

$$
\tilde{u}_{1}=u_{2}, \quad \frac{\partial \tilde{u}_{1}}{\partial \nu}=\frac{\partial u_{2}}{\partial \nu} \quad \text { on } \Sigma \cup \widetilde{\Sigma} .
$$

We consider the following boundary value problem

$$
\begin{cases}\Delta \tilde{u}_{1}+k_{1}^{2} \tilde{u}_{1}=0, \quad \Delta u_{2}+k_{2}^{2} u_{2}=0 & \text { in } \Omega \\ \tilde{u}_{1}=u_{2}, \quad \frac{\partial \tilde{u}_{1}}{\partial \nu}=\frac{\partial u_{2}}{\partial \nu} & \text { on } \partial \Omega .\end{cases}
$$

It follows from Lemma 4.1 that $\tilde{u}_{1}=u_{2}=0$ in $\Omega$. An application of the unique continuation gives $\tilde{u}_{1}=0$ in $R_{1}$, which contradicts the transparent boundary condition (2.9). So we have $S=\widetilde{S}$.

## 5. Local stability

In applications, it is impossible to make exact measurements. Stability is crucial in the practical reconstruction since it contains necessary information to determine to what extent the data can be trusted.

Let $I: \mathbb{R}^{2} \rightarrow \mathbb{R}^{2}$ be the identity mapping or unit matrix and let $\theta: \Gamma \cup S \rightarrow \mathbb{R}^{2}$ be an admissible perturbation, where $\theta$ is assumed to be an admissible perturbation in $C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$ and has a compact support. For $\theta \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, we can extend the definition of function $\theta(x)$ to $\bar{\Omega}_{j}$ by requiring that $\theta(x) \in C^{2}\left(\Omega_{j}, \mathbb{R}^{2}\right) \cap C\left(\bar{\Omega}_{j}, \mathbb{R}^{2}\right) ; I+\theta: \Omega_{j} \rightarrow \Omega_{j, \theta}, j=1,2$. Here the region $\Omega_{j, \theta}$ bounded by $\Gamma_{\theta}$ and $S_{\theta}$, where

$$
\Gamma_{\theta}=\{x+\theta(x): x \in \Gamma\}, \quad S_{\theta}=\{x+\theta(x): x \in S\} .
$$

Here $\theta(x)=\left(\theta_{1}(x), \theta_{2}(x)\right)^{\top}$. According to Theorem 3.1, there exist the unique solutions $\left(u_{1, \theta}, u_{2, \theta}\right)$ to Problem 2.1 corresponding to the region $\Omega_{j, \theta}$ for any small enough $\theta$. The map $\theta \rightarrow u_{\theta}$ is locally differentiable if for every open set $D$ strictly included in $\Omega_{j}$ and strictly included in $\Omega_{j, \theta}$, the restriction of $u_{\theta}$ to $D$ is differentiable [39]. The domain derivative of $u_{j, \theta}$ at $\theta=0$ in the direction $p$ is given by

$$
u_{j}^{\prime}=\frac{\partial u_{j, \theta}}{\partial \theta}(0) p, \quad j=1,2,
$$

where $\frac{\partial u_{j, \theta}}{\partial \theta}(0)=\left.\left(\frac{\partial u_{j, \theta}}{\partial \theta_{1}}, \frac{\partial u_{j, \theta}}{\partial \theta_{2}}\right)\right|_{\theta=0}$ and $p(x)=\left(p_{1}(x), p_{2}(x)\right)^{\top} \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$. Define a nonlinear map

$$
F:\left.\Gamma_{\theta} \cup S_{\theta} \rightarrow u_{1, \theta}\right|_{\Gamma_{1}} .
$$

The domain derivative of the operator $F$ on the boundary $\Gamma \cup S$ along the direction $p$ is defined by

$$
F^{\prime}(\Gamma \cup S, p):=\left.u_{1}^{\prime}\right|_{\Gamma_{1}} .
$$

Define the jumps on $S$ :

$$
\left[u_{1}(x)-u_{2}(x)\right]=\lim _{\substack{a_{1} \rightarrow 0 \\ x+a_{1} \in \Omega_{1}}} u_{1}\left(x+a_{1}\right)-\lim _{\substack{a_{2} \rightarrow 0 \\ x+a_{2} \in \Omega_{2}}} u_{2}\left(x+a_{2}\right)
$$

and

$$
\left[\nu_{S} \cdot \nabla u_{1}(x)-\nu_{S} \cdot \nabla u_{2}(x)\right]=\lim _{h \rightarrow+0} \nu_{S} \cdot \nabla u_{1}\left(x+h \nu_{S}\right)-\lim _{h \rightarrow+0} \nu_{S} \cdot \nabla u_{2}\left(x-h \nu_{S}\right) .
$$

Theorem 5.1. Let $\left(u_{1}, u_{2}\right)$ be the solutions of Problem 2.1. Given $p \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, the domain derivatives $\left(u_{1}^{\prime}, u_{2}^{\prime}\right)$ of $\left(u_{1}, u_{2}\right)$ are the radiating solutions of the following problem:

$$
\begin{cases}\Delta u_{1}^{\prime}+k_{1}^{2} u_{1}^{\prime}=0 & \text { in } \Omega_{1},  \tag{5.1}\\ \Delta u_{2}^{\prime}+k_{2}^{2} u_{2}^{\prime}=0 & \text { in } \Omega_{2}, \\ \nu_{\Gamma} \cdot\left(\nabla u_{1}^{\prime}\right)=k_{1}^{2} p_{\Gamma_{\nu}} u_{1}+\nabla \cdot\left[p_{\Gamma_{\nu}}\left(\nabla_{\Gamma_{\tau}} u_{1}\right)\right] & \text { on } \Gamma, \\ {\left[u_{1}^{\prime}-u_{2}^{\prime}\right]=0} & \text { on } S, \\ {\left[\left(\nu_{S} \cdot \nabla u_{1}^{\prime}\right)-\left(\nu_{S} \cdot \nabla u_{2}^{\prime}\right)\right]=p_{S_{\nu}}\left[k_{1}^{2} u_{1}-k_{2}^{2} u_{2}\right]} & \text { on } S .\end{cases}
$$

Proof. Define the operator

$$
\mathcal{A}=\Delta+k_{1}^{2} I .
$$

Let

$$
\begin{equation*}
\omega_{\theta}=\mathcal{A} u_{1, \theta} \tag{5.2}
\end{equation*}
$$

then, we have

$$
\begin{equation*}
\omega_{\theta}=-\delta \quad \text { in } \Omega_{1, \theta} \tag{5.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\omega_{\theta}(I+\theta)=-\delta \quad \text { in } \Omega_{1} . \tag{5.4}
\end{equation*}
$$

Since $\mathcal{A}$ is a linear and continuous operator from $H_{\text {loc }}^{1}\left(\Omega_{1}\right)$ into $\mathcal{D}^{\prime}\left(\Omega_{1}\right), \mathcal{A}$ is differentiable in the distribution sense, i.e., $\boldsymbol{v} \mapsto\langle\mathcal{A} \boldsymbol{v}, \boldsymbol{\psi}\rangle$ is differentiable for each $\boldsymbol{\psi} \in \mathcal{D}\left(\Omega_{1}\right)$ and

$$
\begin{equation*}
\frac{\partial \mathcal{A}}{\partial \boldsymbol{v}}=\mathcal{A}, \tag{5.5}
\end{equation*}
$$

Here $\mathcal{D}\left(\Omega_{1}\right)$ is the space of infinitely differentiable functions with compact support in $\Omega_{1}$ and $\mathcal{D}^{\prime}\left(\Omega_{1}\right)$ is the space of distributions. Therefore, it follows from the differentiability of $\theta \mapsto u_{1, \theta}(I+\theta)$ and $\theta \mapsto u_{1, \theta}$ that $\theta \mapsto \omega_{\theta}(I+\theta)$ is Fréchet differentiable at $\theta=0$ in the direction $p \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$. Moreover, for an admissible perturbation $\theta$, i.e., $\theta \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, and $\theta$ in the neighborhood of 0 , from (5.3) and (5.4), their derivatives satisfy

$$
\begin{equation*}
\frac{\partial \omega_{\theta}}{\partial \theta}(0) p=\frac{\partial}{\partial \theta}\left(\omega_{\theta}(I+\theta)\right)(0) p-(p \cdot \nabla) \omega=-(p \cdot \nabla) \delta+(p \cdot \nabla) \delta=0 \quad \text { in } \Omega_{1} . \tag{5.6}
\end{equation*}
$$

We deduce from (5.2) and (5.6) that

$$
\begin{equation*}
\frac{\partial \omega_{\theta}}{\partial \theta}(0) p=\left(\frac{\partial \mathcal{A}}{\partial u_{1, \theta}} \frac{\partial u_{1, \theta}}{\partial \theta}\right)(0) p=\frac{\partial \mathcal{A}}{\partial u_{1}} u_{1}^{\prime}=0 \quad \text { in } \Omega_{1} . \tag{5.7}
\end{equation*}
$$

It follows from (5.5) and (5.7) that

$$
\mathcal{A} u_{1}^{\prime}=\Delta u_{1}^{\prime}+k_{1}^{2} u_{1}^{\prime}=0 \quad \text { in } \Omega_{1} .
$$

Furthermore, for every perturbation $\theta \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, the total fields and their normal derivative are assumed to satisfy

$$
u_{1, \theta}=u_{2, \theta}, \quad \nu_{S_{\theta}} \cdot \nabla u_{1, \theta}=\nu_{S_{\theta}} \cdot \nabla u_{2, \theta} \quad \text { on } S_{\theta} .
$$

Hence,

$$
\begin{equation*}
u_{1, \theta}(I+\theta)=u_{2, \theta}(I+\theta) \quad \text { on } S \tag{5.8}
\end{equation*}
$$

and

$$
\begin{equation*}
\left[\nu_{S_{\theta}}(I+\theta)\right] \cdot\left[\left(\nabla u_{1, \theta}\right)(I+\theta)\right]=\left[\nu_{S_{\theta}}(I+\theta)\right] \cdot\left[\left(\nabla u_{2, \theta}\right)(I+\theta)\right] \quad \text { on } S . \tag{5.9}
\end{equation*}
$$

We have from straightforward calculations that

$$
\begin{align*}
& \frac{\partial}{\partial \theta}\left(u_{j, \theta}(I+\theta)\right)(0) p=\frac{\partial u_{j, \theta}}{\partial \theta}(0) p+p \cdot\left(\nabla u_{j}\right)=u_{j}^{\prime}+p \cdot\left(\nabla u_{j}\right) \\
= & u_{j}^{\prime}+\left[p_{S_{\tau}}+p_{S_{\nu}} \nu_{S}\right] \cdot\left[\nabla_{S_{\tau}} u_{j}+\left(\nu_{S} \cdot \nabla u_{j}\right) \nu_{S}\right] \\
= & u_{j}^{\prime}+\left[p_{S_{\tau}} \cdot\left(\nabla_{S_{\tau}} u_{j}\right)\right]+\left[p_{S_{\nu}}\left(\nu_{S} \cdot \nabla u_{j}\right)\right] \quad \text { on } S . \tag{5.10}
\end{align*}
$$

Considering the boundary conditions (2.8) and $p \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, we have from (5.8) and (5.10) that

$$
\begin{equation*}
\left[u_{1}^{\prime}-u_{2}^{\prime}\right]=-p_{S_{\tau}} \cdot\left[\nabla_{S_{\tau}} u_{1}-\nabla_{S_{\tau}} u_{2}\right]-p_{S_{\nu}}\left[\left(\nu_{S} \cdot \nabla u_{1}\right)-\left(\nu_{S} \cdot \nabla u_{2}\right)\right] \quad \text { on } S \text {. } \tag{5.11}
\end{equation*}
$$

It follows from $\left[u_{1}-u_{2}\right]=0$ on $S$, and the definition of the surface gradient that

$$
\begin{equation*}
\left[\nabla_{S_{\tau}} u_{1}-\nabla_{S_{\tau}} u_{2}\right]=0, \quad \nabla\left(u_{1}-u_{2}\right)=\left[\nu_{S} \cdot \nabla\left(u_{1}-u_{2}\right)\right] \nu_{S} \quad \text { on } S . \tag{5.12}
\end{equation*}
$$

From (5.11) and (5.12), the jump relations now yield

$$
\begin{equation*}
\left[u_{1}^{\prime}-u_{2}^{\prime}\right]=-p_{S_{\nu}}\left[\left(\nu_{S} \cdot \nabla u_{1}\right)-\left(\nu_{S} \cdot \nabla u_{2}\right)\right]=0 \quad \text { on } S . \tag{5.13}
\end{equation*}
$$

It follows from [15, Lemma 3] or [36, Lemma 4.8] that

$$
\begin{equation*}
\nu_{S_{\theta}}(I+\theta)=\frac{1}{\left\|g(\theta) \nu_{S}\right\|_{2}} g(\theta) \nu_{S} \quad \text { on } S \tag{5.14}
\end{equation*}
$$

and

$$
\begin{equation*}
\nu_{\Gamma_{\theta}}(I+\theta)=\frac{1}{\left\|g(\theta) \nu_{\Gamma}\right\|_{2}} g(\theta) \nu_{\Gamma} \quad \text { on } \Gamma \tag{5.15}
\end{equation*}
$$

where the matrix $g(\theta)$ is given by

$$
g(\theta)=\left[(I+\theta)^{\prime}\right]^{-\top}=\left[\begin{array}{cc}
1+\frac{\partial \theta_{1}(x)}{x_{1}} & \frac{\partial \theta_{1}(x)}{\partial x_{2}} \\
\frac{\partial \theta_{2}(x)}{\partial x_{1}} & 1+\frac{\partial \theta_{2}(x)}{\partial x_{2}}
\end{array}\right]^{-\top} \quad \text { on } \Gamma \cup S
$$

and satisfies

$$
g(0)=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right], \quad \frac{\partial g(\theta)}{\partial \theta}(0) p=-(\nabla p)^{\top}=-\left[\begin{array}{ll}
\frac{\partial p_{1}}{\partial x_{1}} & \frac{\partial p_{1}}{\partial x_{2}} \\
\frac{p_{2}}{\partial x_{1}} & \frac{\partial p_{2}}{\partial x_{2}}
\end{array}\right]^{\top} .
$$

Therefore we get from (5.9) and (5.14) that

$$
\left[g(\theta) \nu_{S}\right] \cdot\left[\left(\nabla u_{1, \theta}\right)(I+\theta)\right]=\left[g(\theta) \nu_{S}\right] \cdot\left[\left(\nabla u_{2, \theta}\right)(I+\theta)\right] \quad \text { on } S .
$$

which implies that

$$
\begin{equation*}
\left[g(\theta) \nu_{S}\right] \cdot\left[g(\theta) \nabla\left(u_{1, \theta}(I+\theta)\right)\right]=\left[g(\theta) \nu_{S}\right] \cdot\left[g(\theta) \nabla\left(u_{2, \theta}(I+\theta)\right)\right] \quad \text { on } S . \tag{5.16}
\end{equation*}
$$

Using the chain rule, we deduce from (5.16) that

$$
\begin{align*}
& \frac{\partial}{\partial \theta}\left\{\left[g(\theta) \nu_{S}\right] \cdot\left[g(\theta) \nabla\left(u_{j, \theta}(I+\theta)\right)\right]\right\}(0) p \\
&= {\left[\left(\frac{\partial g(\theta)}{\partial \theta}(0) p\right) \nu_{S}\right] \cdot\left[g(0)\left(\nabla u_{j}\right)\right]+\left(g(0) \nu_{S}\right) \cdot\left[\left(\frac{\partial g(\theta)}{\partial \theta}(0) p\right)\left(\nabla u_{j}\right)\right] } \\
&+\left(g(0) \nu_{S}\right) \cdot\left[g(0) \frac{\partial}{\partial \theta}\left(\nabla\left(u_{j, \theta}(I+\theta)\right)\right)(0) p\right] \\
&= {\left[\left(\frac{\partial g(\theta)}{\partial \theta}(0) p\right) \nu_{S}\right] \cdot\left(\nabla u_{j}\right)+\nu_{S} \cdot\left[\left(\frac{\partial g(\theta)}{\partial \theta}(0) p\right)\left(\nabla u_{j}\right)\right] } \\
&+\nu_{S} \cdot\left[\nabla\left(\frac{\partial}{\partial \theta}\left(u_{j, \theta}(I+\theta)\right)(0) p\right)\right] \\
&=- {\left[(\nabla p)^{\top} \nu_{S}\right] \cdot\left(\nabla u_{j}\right)-\nu_{S} \cdot\left[(\nabla p)^{\top}\left(\nabla u_{j}\right)\right]+\nu_{S} \cdot\left[\nabla u_{j}^{\prime}+\nabla\left(p \cdot\left(\nabla u_{j}\right)\right)\right] } \\
&=- {\left[(\nabla p)^{\top} \nu_{S}\right] \cdot\left(\nabla u_{j}\right)-\nu_{S} \cdot\left[(\nabla p)^{\top}\left(\nabla u_{j}\right)\right]+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right) } \\
&+\nu_{S} \cdot\left\{p \times\left[\nabla \times\left(\nabla u_{j}\right)\right]+(p \cdot \nabla)\left(\nabla u_{j}\right)+\left[\left(\nabla u_{j}\right) \times(\nabla \times p)+\left(\left(\nabla u_{j}\right) \cdot \nabla\right) p\right]\right\} \\
&=- {\left[(\nabla p)^{\top} \nu_{S}\right] \cdot\left(\nabla u_{j}\right)-\nu_{S} \cdot\left[(\nabla p)^{\top}\left(\nabla u_{j}\right)\right]+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right) } \\
&+\nu_{S} \cdot\left\{(p \cdot \nabla)\left(\nabla u_{j}\right)+\left[\left(\nabla u_{j}\right) \times(\nabla \times p)+\left(\left(\nabla u_{j}\right) \cdot \nabla\right) p\right]\right\} \quad \text { on } S . \tag{5.17}
\end{align*}
$$

Since on $S \cup \Gamma$, for $j=1,2$, one can easily verify that

$$
\begin{aligned}
& {\left[(\nabla p)^{\top}\left(\nabla u_{j}\right)\right]=\left[\left(\nabla u_{j}\right) \times(\nabla \times p)+\left(\left(\nabla u_{j}\right) \cdot \nabla\right) p\right]} \\
& {\left[(\nabla p)^{\top} \nu\right]=[\nu \times(\nabla \times p)+(\nu \cdot \nabla) p]=\nabla(p \cdot \nu)-[(p \cdot \nabla) \nu]-[p \times(\nabla \times \nu)]} \\
& \quad=\nabla(p \cdot \nu)-[(p \cdot \nabla) \nu], \\
& {[(p \cdot \nabla) \nu] \cdot\left(\nabla u_{j}\right)+\nu \cdot\left[(p \cdot \nabla)\left(\nabla u_{j}\right)\right]=(p \cdot \nabla)\left(\nu \cdot \nabla u_{j}\right),} \\
& {[(p \cdot \nabla) \nu] \cdot \nu=\frac{1}{2}(p \cdot \nabla)(\nu \cdot \nu)=\frac{1}{2}(p \cdot \nabla)\left(|\nu|^{2}\right)=\frac{1}{2}(p \cdot \nabla)(1)=0 .}
\end{aligned}
$$

With the aid of (5.17), we obtain

$$
\begin{align*}
& \frac{\partial}{\partial \theta}\left\{\left[g(\theta) \nu_{S}\right] \cdot\left[g(\theta) \nabla\left(u_{j, \theta}(I+\theta)\right)\right]\right\}(0) p \\
& =-\left[(\nabla p)^{\top} \nu_{S}\right] \cdot\left(\nabla u_{j}\right)-\nu_{S} \cdot\left[(\nabla p)^{\top}\left(\nabla u_{j}\right)\right] \\
& \quad \quad+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\nu_{S} \cdot\left[(\nabla p)^{\top}\left(\nabla u_{j}\right)\right]+\nu_{S} \cdot\left[(p \cdot \nabla)\left(\nabla u_{j}\right)\right] \\
& =-\left[\nabla\left(p \cdot \nu_{S}\right)\right] \cdot\left(\nabla u_{j}\right)+\left[(p \cdot \nabla) \nu_{S}\right] \cdot\left(\nabla u_{j}\right)+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\nu_{S} \cdot\left[(p \cdot \nabla)\left(\nabla u_{j}\right)\right] \\
& =-\left[\nabla\left(p \cdot \nu_{S}\right)\right] \cdot\left(\nabla u_{j}\right)+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\left[(p \cdot \nabla)\left(\nu_{S} \cdot \nabla u_{j}\right)\right] \\
& =-\nabla \cdot\left[\left(p \cdot \nu_{S}\right)\left(\nabla u_{j}\right)\right]+\left(p \cdot \nu_{S}\right)\left(\Delta u_{j}\right)+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\left[(p \cdot \nabla)\left(\nu_{S} \cdot \nabla u_{j}\right)\right] \\
& =-\nabla \cdot\left[\left(p \cdot \nu_{S}\right)\left(\nabla u_{j}\right)\right]-\left(p \cdot \nu_{S}\right)\left(k_{j}^{2} u_{j}\right)+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\left[(p \cdot \nabla)\left(\nu_{S} \cdot \nabla u_{j}\right)\right] \\
& =-\nabla \cdot\left[p_{S_{\nu}}\left(\nabla_{S_{\tau}} u_{j}\right)+p_{S_{\nu}}\left(\nu_{S} \cdot \nabla u_{j}\right) \nu_{S}\right]-p_{S_{\nu}}\left(k_{j}^{2} u_{j}\right)+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\left[(p \cdot \nabla)\left(\nu_{S} \cdot \nabla u_{j}\right)\right] \\
& =-\nabla \cdot\left[p_{S_{\nu}}\left(\nabla_{S_{\tau}} u_{j}\right)\right]-\nabla \cdot\left[\left(\nu_{S} \cdot \nabla u_{j}\right)\left(p_{S_{\nu}} \nu_{S}\right)\right] \\
& \quad \quad \quad-p_{S_{\nu}}\left(k_{j}^{2} u_{j}\right)+\nu_{S} \cdot\left(\nabla u_{j}^{\prime}\right)+\left[(p \cdot \nabla)\left(\nu_{S} \cdot \nabla u_{j}\right)\right] \tag{5.18}
\end{align*}
$$

By the continuous conditions (2.8) and $p \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, from (5.16) and (5.18), the jump relations now yield

$$
\begin{aligned}
{\left[\nu_{S} \cdot\left(\nabla u_{1}^{\prime}\right)-\nu_{S} \cdot\left(\nabla u_{2}^{\prime}\right)\right] } & =p_{S_{\nu}}\left[k_{1}^{2} u_{1}-k_{2}^{2} u_{2}\right]+\nabla \cdot\left[p_{S_{\nu}}\left(\nabla_{S_{\tau}} u_{1}-\nabla_{S_{\tau}} u_{2}\right)\right] \\
& =p_{S_{\nu}}\left[k_{1}^{2} u_{1}-k_{2}^{2} u_{2}\right] .
\end{aligned}
$$

Moreover, for every perturbation $\theta \in C^{2}\left(\Gamma \cup S, \mathbb{R}^{2}\right)$, the total fields and their normal derivative are assumed to satisfy

$$
\nu_{\Gamma_{\theta}} \cdot \nabla u_{1, \theta}=0 \quad \text { on } \Gamma_{\theta} .
$$

Hence,

$$
\begin{equation*}
\left[\nu_{\Gamma_{\theta}}(I+\theta)\right] \cdot\left[\left(\nabla u_{1, \theta}\right)(I+\theta)\right]=0 \quad \text { on } \Gamma \tag{5.19}
\end{equation*}
$$

It follows from (5.15) and (5.19) that

$$
\begin{aligned}
& {\left[\nu_{\Gamma_{\theta}}(I+\theta)\right] \cdot\left[\left(\nabla u_{1, \theta}\right)(I+\theta)\right]} \\
& =\frac{1}{\left\|g(\theta) \nu_{\Gamma}\right\|_{2}}\left[g(\theta) \nu_{\Gamma}\right] \cdot\left[g(\theta) \nabla\left(u_{1, \theta}(I+\theta)\right)\right]=0 \quad \text { on } \Gamma,
\end{aligned}
$$

which gives

$$
\begin{equation*}
\left[g(\theta) \nu_{\Gamma}\right] \cdot\left[g(\theta) \nabla\left(u_{1, \theta}(I+\theta)\right)\right]=0 \quad \text { on } \Gamma \text {. } \tag{5.20}
\end{equation*}
$$

Using (5.20) and the sound hard boundary condition (2.7), we may follow the same steps as those for (5.18) and obtain

$$
\begin{aligned}
0 & =\frac{\partial}{\partial \theta}\left\{\left[g(\theta) \nu_{\Gamma}\right] \cdot\left[g(\theta) \nabla\left(u_{1, \theta}(I+\theta)\right)\right]\right\}(0) p \\
& =-\nabla \cdot\left[p_{\Gamma_{\nu}}\left(\nabla_{\Gamma_{\tau}} u_{1}\right)\right]-p_{\Gamma_{\nu}}\left(k_{1}^{2} u_{1}\right)+\nu_{\Gamma} \cdot\left(\nabla u_{1}^{\prime}\right) \quad \text { on } \Gamma,
\end{aligned}
$$

which yields that

$$
\nu_{\Gamma} \cdot\left(\nabla u_{1}^{\prime}\right)=k_{1}^{2} p_{\Gamma_{\nu}} u_{1}+\nabla \cdot\left[p_{\Gamma_{\nu}}\left(\nabla_{\Gamma_{\tau}} u_{1}\right)\right] \quad \text { on } \Gamma \text {. }
$$

Based on the existence of the domain derivatives $u_{j}^{\prime}$, the proof of the the integral representations for $u_{j}^{\prime}$ follow in the same manner as for the the integral representation of $u_{j}$. Therefore, the asymptotic behavior to the domain derivative $u_{j}^{\prime}$ has the same form as $u_{j}$. This means that the domain derivatives $\left(u_{1}^{\prime}, u_{2}^{\prime}\right)$ are the radiating solutions of the problem (5.1).

Introduce the domain $\Omega_{1, h}$ bounded by $\Gamma_{h}$ and $S_{h}$, where

$$
\Gamma_{h}=\left\{x+h q(x) \nu_{\Gamma}: x \in \Gamma\right\}, \quad S_{h}=\left\{x+h q(x) \nu_{S}: x \in S\right\} .
$$

where $q \in C^{2}(\Gamma \cup S, \mathbb{R})$ and $h>0$. For any two domains $\Omega_{1}$ and $\Omega_{1, h}$ in $\mathbb{R}^{2}$, define the Hausdorff distance

$$
\operatorname{dist}\left(\Omega_{1}, \Omega_{1, h}\right)=\max \left\{d\left(\Omega_{1, h}, \Omega_{1}\right), d\left(\Omega_{1}, \Omega_{1, h}\right)\right\}
$$

where

$$
d\left(\Omega_{1}, \Omega_{1, h}\right)=\sup _{x \in \Omega_{1}} \inf _{y \in \Omega_{1, h}}|x-y| .
$$

It can be easily seen that the Hausdorff distance between $\Omega_{1, h}$ and $\Omega_{1}$ is of the order $h$, i.e., $\operatorname{dist}\left(\Omega_{1}, \Omega_{1, h}\right)=\mathcal{O}(h)$. We have the following local stability result.
Theorem 5.2. If $q \in C^{2}(\Gamma \cup S, \mathbb{R})$ and $h>0$ is sufficiently small, then

$$
\operatorname{dist}\left(\Omega_{1}, \Omega_{1, h}\right) \leq C\left\|u_{1, h}-u_{1}\right\|_{C^{1, \alpha}\left(\Gamma_{1}\right)}
$$

where $u_{1, h}$ and $u_{1}$ is the solution of Problem 2.1 corresponding to the domain $\Omega_{1, h}$ and $\Omega_{1}$, respectively, and $C$ is a positive constant independent of $h$.

Proof. Assume by contradiction that there exists a subsequence from $\left\{u_{1, h}\right\}$, which is still denoted as $\left\{u_{1, h}\right\}$ for simplicity, such that

$$
\lim _{h \rightarrow 0}\left\|\frac{u_{1, h}-u_{1}}{h}\right\|_{C^{1, \alpha}\left(\Gamma_{1}\right)}=\left\|u_{1}^{\prime}\right\|_{C^{1, \alpha}\left(\Gamma_{1}\right)}=0, \quad h \rightarrow 0
$$

which yields $u_{1}^{\prime}=0$ on $\Gamma_{1}$. Following a similar proof of Theorem 3.1, we can show the uniqueness of the solution for problem (5.1). An application of the uniqueness for problem (5.1) yields that $u_{j}^{\prime}=0$ in $\bar{\Omega}_{j}, j=1,2$. Hence, $\nabla u_{j}^{\prime}=0$ in $\bar{\Omega}_{j}, j=1,2$.

Taking $p=q(x) \nu_{\Gamma}$ on $\Gamma$ in problem (5.1), we have from the boundary condition of $u_{1}^{\prime}$ in problem (5.1) that

$$
\nu_{\Gamma} \cdot\left(\nabla u_{1}^{\prime}\right)=k_{1}^{2} q u_{1}+\nabla \cdot\left[q\left(\nabla_{\Gamma_{\tau}} u_{1}\right)\right]=0 .
$$

Since $q$ is arbitrary, we have $u_{1}=0$ on $\Gamma$, which is impossible by Lemma 4.3.
Consider the perturbation on $S$, take $p(x)=q(x) \nu_{S}$ on $S$ in problem (5.1), from $u_{j}^{\prime}=0$ and $\nabla u_{j}^{\prime}=0$ in $\bar{\Omega}_{j}, j=1,2$, one can get

$$
\nu_{S} \cdot \nabla u_{1}^{\prime}-\nu_{S} \cdot \nabla u_{2}^{\prime}=0 \quad \text { on } S .
$$

One the other hand, from Theorem 5.1, one can get

$$
\left(\nu_{S} \cdot \nabla u_{1}^{\prime}\right)-\left(\nu_{S} \cdot \nabla u_{2}^{\prime}\right)=p_{S_{\nu}}\left[k_{1}^{2} u_{1}-k_{2}^{2} u_{2}\right]=q\left(k_{1}^{2}-k_{2}^{2}\right) u_{1} \quad \text { on } S .
$$

For $q \neq 0$ and $k_{1}^{2} \neq k_{2}^{2}$, it follows that $u_{1}=0$ on $S$, which is again impossible by Lemma 4.3.
The result indicates that for small $h$, if the boundary measurements are $\mathcal{O}(h)$ close to each other, then the corresponding domains are also $\mathcal{O}(h)$ close to each other in the Hausdorff distance.

## 6. Conclusion

In this paper, we have studied the direct and inverse scattering problems of a point incident field by a sound hard obstacle which is immersed in a two-layered background medium separated by an infinite rough surface. The uniqueness of the solution for the direct scattering problem is proved. The existence of the solution for the direct scattering problem is discussed by using the method of boundary integral equations. For the inverse problem, we prove that the obstacle and the infinite rough surface are uniquely determined by the wave fields measured on two plane surfaces via a single point incident field. Moreover, we study the local stability of the inverse problem. It demonstrates that the Hausdorff distance of two domains is bounded above by the distance of the correspond wave fields if the two domains are close enough. A crucial step in the proof of the stability is to obtain the existence and characterization of the domain derivative of the wave field with respect to the change of the shape of the obstacle and the infinite rough surface. We deduce that the domain derivative satisfies a boundary value problem of the Helmholtz equation. The results are valid for the three-dimensional problem and the multiple obstacles which are located either above or below the infinite rough surface.
