1. The parents of a teenager child woke up in the middle of the night and suspected their kid had broken their 11:00 p.m. curfew. The parents noticed that the child had forgotten a cup of coffee outside the front door. Since they were familiar with Newton's law of cooling, they thought they could use it to determine the time the child got home, and so they decided to measure its temperature. The temperature outside was $30^{\circ} \mathrm{F}$ and had not changed since 6:00 p.m. of the previous day. At 1:00 a.m. the temperature of the coffee was $35^{\circ} \mathrm{F}$ and at 2:00 a.m. its temperature was $32.5^{\circ} \mathrm{F}$. The parents estimated that the temperature of the coffee must have been about 70 degrees (cold enough not to be noticed) when the child got home. At what time did the child get home?
