Part I Basic Concepts of Mathematical Epidemiology

1 Introduction: A Prelude to Mathematical Epidemiology ...... 3
  1.1 Introduction ......................................................... 3
  1.2 Some History .......................................................... 4
    1.2.1 The Beginnings of Compartmental Models ................. 5
    1.2.2 Stochastic Models ............................................ 7
    1.2.3 Developments in Compartmental Models ................. 9
    1.2.4 Endemic disease models .................................. 11
    1.2.5 Diseases transmitted by vectors ....................... 12
    1.2.6 Heterogeneity of mixing ................................. 14
  1.3 Strategic Models and this Volume ............................. 15
References .................................................................. 16

2 Simple Compartmental Models for Disease Transmission ...... 21
  2.1 Introduction to Compartmental Models .......................... 22
  2.2 The SIS Model ....................................................... 26
  2.3 The SIR Model with Births and Deaths ....................... 30
  2.4 The Simple Kermack-McKendrick Epidemic Model .......... 34
  2.5 Epidemic Models with Deaths due to Disease .............. 42
  2.6 *Project: Discrete Epidemic Models .......................... 44
  2.7 *Project: Pulse Vaccination .................................... 46
  2.8 *Project: A Model with Competing Disease Strains ....... 48
  2.9 Project: An Epidemic Model in Two Patches ................ 51
  2.10 Project: Fitting Data for an Influenza Model ............. 51
  2.11 Project: Social Interactions ................................... 52
  2.12 Exercises ............................................................ 53
3 Endemic Disease Models

3.1 More Complicated Endemic Disease Models

3.1.1 Exposed periods
3.1.2 A treatment model
3.1.3 Vertical transmission

3.2 Some Applications of the SIR Model

3.2.1 Herd immunity
3.2.2 Age at infection
3.2.3 The inter-epidemic period
3.2.4 “Epidemic” approach to endemic equilibrium

3.3 Temporary Immunity

3.3.1 *Delay in an SIRS model

3.4 A Simple Model with Multiple Endemic Equilibria

3.5 A Vaccination Model: Backward Bifurcations

3.6 *An SEIR Model with General Disease Stage Distributions

3.6.1 *Incorporation of quarantine and isolation
3.6.2 *The reduced model of (3.42) under GDA
3.6.3 *Comparison of EDM and GDM

3.7 Diseases in Exponentially Growing Populations

3.8 Project: Population Growth and Epidemics

3.9 *Project: An Environmentally Driven Infectious Disease
3.10 *Project: A Two-Strain Model with Cross Immunity
3.11 Exercises

References

4 Epidemic Models

4.1 A Branching Process Disease Outbreak Model

4.1.1 Transmissibility

4.2 Network and Compartmental Epidemic Models

4.3 More Complicated Epidemic Models

4.3.1 Exposed periods
4.3.2 A treatment model
4.3.3 An influenza model
4.3.4 A quarantine-isolation model

4.4 An SIR model with a General Infectious Period Distribution

4.5 The Age of Infection Epidemic Model

4.5.1 A general SEIR model
4.5.2 A general treatment model
4.5.3 A general quarantine/isolation epidemic model

4.6 The Gamma Distribution

4.7 Interpretation of Data and Parametrization

4.7.1 Models of SIR Type
5 Models with Heterogeneous Mixing

5.1 A Vaccination Model ........................................ 173
5.2 The Next Generation Matrix and the Basic Reproduction Number .. 175
  5.2.1 Some More Complicated Examples .......................... 181
5.3 Heterogeneous Mixing ......................................... 181
  5.3.1 *Optimal vaccine allocation in heterogeneous populations . 195
5.4 A Heterogeneous Mixing Age of Infection Model .................. 201
  5.4.1 The final size of a heterogeneous mixing epidemic ............ 203
5.5 Some Warnings ............................................... 207
5.6 *Projects: Reproduction Numbers for Discrete Models .......... 208
5.7 *Project: Modeling the Synergy between HIV and HSV-2 ........... 211
5.8 Project: Effect of Heterogeneities on Reproduction Numbers .... 214
References ......................................................... 215

6 Models for Diseases Transmitted by Vectors

6.1 Introduction ............................................... 219
6.2 A Basic Vector Transmission Models ................................ 220
  6.2.1 The basic reproduction number ............................ 222
  6.2.2 The initial exponential growth rate ....................... 223
6.3 Fast and Slow Dynamics ...................................... 224
  6.3.1 Singular perturbations ................................... 226
6.4 A Vector-borne Epidemic model ................................ 228
  6.4.1 A final size relation .................................... 229
6.5 *Project: An SEIR/SEI Model .................................. 230
6.6 *Project: Models for Onchocerciasis ............................ 231
6.7 Exercises ..................................................... 233
References ......................................................... 234

Part II Models for Specific Diseases

7 Models for Tuberculosis ........................................ 239
7.1 A One-strain Model with Treatment ............................. 241
7.2 A Two-strain TB Model ....................................... 242
7.3 Optimal Treatment Strategies ................................ 246
7.4 Modeling of the Long and Variable Latency of TB ............. 251
7.5 Backward Bifurcation in a TB Model with Reinfection ......... 253
8 Models for HIV/AIDS
8.1 Introduction ........................................... 265
8.2 A Model with Exponential Waiting Times ............. 267
8.3 An HIV Model with Arbitrary Incubation Period Distributions ........... 270
8.4 An Age of Infection Model ............................... 273
8.5 *HIV and Tuberculosis: Dynamics of Co-infections ............... 275
8.6 *Modeling the Synergy between HIV and HSV-2 ...... 283
  8.6.1 Reproduction numbers for individual diseases .... 286
  8.6.2 Invasion reproduction numbers ....................... 288
  8.6.3 Influence of HSV-2 on the dynamics of HIV ........... 289
8.7 An HIV Model with Vaccination ......................... 290
8.8 A Model with Antiretroviral Therapy (ART) .......... 291
8.9 Project: What If Not All Infectives Progress to AIDS? ..... 293
References ............................................. 295

9 Models for Influenza .................................. 303
9.1 Introduction to Influenza Models ....................... 303
9.2 A Basic Influenza Model ............................... 304
  9.2.1 Vaccination ........................................ 307
9.3 Antiviral Treatment .................................... 310
9.4 Seasonal Influenza Epidemics .......................... 315
  9.4.1 Season to Season Transition ....................... 317
9.5 Pandemic Influenza .................................... 318
  9.5.1 A pandemic outbreak ................................ 318
  9.5.2 Seasonal outbreaks following a pandemic .......... 319
9.6 The Influenza Pandemic of 2009 ......................... 321
  9.6.1 A tactical influenza model ....................... 322
  9.6.2 Multiple epidemic waves .......................... 323
  9.6.3 Parameter estimation and forecast of the fall wave .... 325
9.7 *An SIQR model with Multiple Strains with Cross Immunity ...... 328
  9.7.1 *An SIQR Model with a Single Infectious Class .... 330
  9.7.2 *The case of two strains with cross Immunity ....... 334
9.8 Exercises ............................................. 338
References ............................................. 339

10 Models for Ebola ................................... 343
10.1 Estimation of initial growth and reproduction numbers ...... 343
  10.1.1 Early detection .................................. 349
10.2 Evaluations of control measures ........................ 352
## Contents

10.3 The Legrand model and underlying assumptions ............... 353  
10.3.1 The Legrand model ........................................ 354  
10.3.2 A simpler system equivalent to the Legrand model ....... 355  
10.4 *Models with various assumptions on stage transition times .... 356  
10.5 Slower than Exponential Growth ................................ 372  
10.5.1 The generalized Richards model ........................... 373  
10.5.2 The generalized growth model ............................. 373  
10.5.3 The IDEA model ............................................ 374  
10.5.4 Models with decreasing contact rates ....................... 375  
10.6 Project: Slower than Exponential Growth ....................... 375  
10.7 Project: Movement Restrictions as a Control Strategy ........ 376  
10.8 Project: Effect of Early Detection ............................ 377  
References ..................................................................... 378

11 Models for Malaria ...................................................... 381  
11.1 A Malaria Model .................................................. 381  
11.2 Some Model Refinements ....................................... 385  
11.2.1 Mosquito incubation periods .............................. 385  
11.2.2 Boosting of immunity .................................... 386  
11.2.3 Alternative forms for the force of infection .......... 387  
11.3 *Coupling Malaria Epidemiology and Sickle Cell Genetics ... 387  
References ..................................................................... 396

12 Dengue Fever and the Zika Virus .................................. 399  
12.1 Dengue Fever ..................................................... 399  
12.1.1 Calculation of the basic reproduction number ........... 401  
12.2 A Model with Asymptomatic Infectives ....................... 402  
12.2.1 Calculation of the basic reproduction number .......... 402  
12.3 The Zika Virus .................................................... 403  
12.4 A Model with Vector and Direct Transmission ............... 404  
12.4.1 The initial exponential growth rate ...................... 407  
12.5 A Second Zika Virus Model .................................... 409  
12.6 Project: A Dengue Model with Two Patches ................. 410  
References ..................................................................... 412

Part III  More Advanced Concepts

13 Disease Transmission Models with Age Structure .................. 419  
13.1 Introduction ....................................................... 419  
13.2 Linear Age Structured Models ................................ 420  
13.3 The Method of Characteristics ................................ 422  
13.4 Equivalent Formulation as an Integral Equation Model ....... 422  
13.5 Equilibria and the characteristic equation .................... 424  
13.6 The Demographic Model with Discrete Age Groups ........ 425  
13.7 Nonlinear Age Structured Models .............................. 426  
13.8 Age Structured Epidemic Models .............................. 428
### 16 Challenges, Opportunities and Theoretical Epidemiology

### Part V Appendix

#### Appendix

- Vectors and Matrices: 531
  - A.1 Introduction: 531
  - A.2 Vectors and Matrices: 531
  - A.3 Systems of Linear Equations: 535
  - A.4 The Inverse Matrix: 536
  - A.5 Determinants: 537
  - A.6 Eigenvalues and Eigenvectors: 540

- First Order Equations: 545
  - B.1 Exponential Growth and Decay: 545
  - B.2 Radioactive decay: 547
  - B.3 Solutions and Direction Fields: 549
  - B.4 Equations with Variables Separable: 555
  - B.5 Qualitative Properties: 560

- Systems of Differential Equations: 569
  - C.1 The Phase Plane: 569
  - C.2 Linearization at an Equilibrium: 571
  - C.3 Linear Systems with Constant Coefficients: 574
  - C.4 Stability of Equilibria: 582
  - C.5 Qualitative Behavior of Solutions of Linear Systems: 586
