

## 4.7 l'Hospital's Rule

revisit an old problem:  $\lim_{x \rightarrow 2} \frac{x^2 + x - 6}{x^2 - 4} \rightarrow \frac{4 + 2 - 6}{4 - 4} \rightarrow \frac{0}{0}$

old way:  $\lim_{x \rightarrow 2} \frac{x^2 + x - 6}{x^2 - 4}$

$$= \lim_{x \rightarrow 2} \frac{(x+3)(\cancel{x-2})}{(x+2)(\cancel{x-2})} = \boxed{\frac{5}{4}}$$

↑  
indeterminate form  
of  $\frac{0}{0}$

$\frac{0}{0}$  is actually  $\frac{\text{Small \#}}{\text{Small \#}}$

today, we'll use l'Hospital's Rule to handle limits  
that seem to want to go to  $\frac{0}{0}$  or  $\frac{\infty}{\infty}$

↑  
indeterminate form  
of  $\frac{\infty}{\infty}$  ( $\frac{\text{big \#}}{\text{big \#}}$ )

## l'Hospital's Rule

named after a French noble and mathematician  
Marquis de l'Hospital

$$\text{if } \lim_{x \rightarrow a} \frac{f(x)}{g(x)} \rightarrow \frac{0}{0} \text{ or } \frac{\infty}{\infty}$$

$$\text{then } \lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$$

example  $\lim_{x \rightarrow 2} \frac{x^2 + x - 6}{x^2 - 4} \rightarrow \frac{0}{0}$  so we can use l'Hospital's Rule

→  $\stackrel{\text{l'Hospital's Rule is used}}{=} \lim_{x \rightarrow 2} \frac{2x + 1}{2x}$  now let  $x$  go to 2

$$= \frac{2(2) + 1}{2(2)} = \boxed{\frac{5}{4}}$$

same as the "old way"

example

$$\lim_{x \rightarrow 0} \frac{x + \sin 2x}{x - \sin 2x} \rightarrow \frac{0}{0}$$

MUST see  $\frac{0}{0}$  or  $\frac{\infty}{\infty}$  in order  
to use l'Hospital's Rule

$$\stackrel{L}{=} \lim_{x \rightarrow 0} \frac{1 + (\cos 2x)(2)}{1 - (\cos 2x)(2)}$$

$$\text{as } x \rightarrow 0, \quad 1 + 2 \cos 2x = 3$$

$$1 - 2 \cos 2x = -1$$

so, the limit is not going to  
 $\frac{0}{0}$  or  $\frac{\infty}{\infty}$  anymore

$$= \frac{3}{-1} = \boxed{-3}$$

example

$$\lim_{x \rightarrow 0} \frac{x + \sin 2x}{x - \cos 2x} \rightarrow \frac{0}{-1}$$

NOT  $\frac{0}{0}$  or  $\frac{\infty}{\infty}$ , so do NOT  
use l'Hospital's Rule

$$= \frac{0}{-1} = \boxed{0}$$

example which of the following grows faster as  $x \rightarrow \infty$

$$f(x) = x^2 \quad \text{or} \quad g(x) = 2^x$$

if  $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = \lim_{x \rightarrow \infty} \frac{x^2}{2^x} = 0$  then that means  $2^x$  is much bigger than  $x^2$  as  $x \rightarrow \infty$ , so  $2^x$  grows faster

if  $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = \lim_{x \rightarrow \infty} \frac{x^2}{2^x} = \infty$  then  $x^2$  is much bigger than  $2^x$  as  $x \rightarrow \infty$ , so  $x^2$  grows faster

$$\lim_{x \rightarrow \infty} \frac{x^2}{2^x} \rightarrow \frac{\infty}{\infty} = ?$$

But since we see  $\frac{\infty}{\infty}$ , we can use l'Hospital's Rule

$$\lim_{x \rightarrow \infty} \frac{x^2}{2^x}$$

$$\stackrel{L}{=} \lim_{x \rightarrow \infty} \frac{2x}{2^x \cdot \ln 2} \rightarrow \frac{\infty}{\infty}$$

$$\frac{d}{dx} (2^x) = 2^x \cdot \ln 2$$

we see  $\frac{\infty}{\infty}$  again, so we use l'Hospital's Rule again (keep using it until we no longer see  $\frac{\infty}{\infty}$  or  $\frac{0}{0}$ )

$$\stackrel{L}{=} \lim_{x \rightarrow \infty} \frac{2}{(2^x \cdot \ln 2) \cdot \ln 2} \rightarrow \frac{2}{\infty}$$

Do NOT use l'Hospital the third time

$$= \boxed{0}$$

so,  $2^x$  grows faster than  $x^2$

Other indeterminate forms:  $\underbrace{\infty - \infty}$ ,  $\underbrace{1^\infty}$ ,  $\underbrace{\infty \cdot 0}$   
 which  $\infty$  is bigger? ( $\#$  close to 1) <sup>big #</sup> (big #) (small #)

example  $\lim_{x \rightarrow 0^+} \left( \frac{1}{x} - \frac{1}{e^x - 1} \right) \rightarrow \infty - \infty = ?$

transform this into  $\frac{\infty}{\infty}$  or  $\frac{0}{0}$  and then use l'Hospital's Rule

$$= \lim_{x \rightarrow 0^+} \left( \frac{e^x - 1}{x(e^x - 1)} - \frac{x}{x(e^x - 1)} \right)$$

$$= \lim_{x \rightarrow 0^+} \frac{e^x - 1 - x}{x(e^x - 1)} \rightarrow \frac{0}{0} \quad \text{we can now use l'Hospital's Rule}$$

$$\stackrel{L}{=} \lim_{x \rightarrow 0^+} \frac{e^x - 1}{xe^x + (e^x - 1)} \quad \text{product rule in denominator}$$

$$= \lim_{x \rightarrow 0^+} \frac{e^x - 1}{xe^x + (e^x - 1)} \rightarrow \frac{0}{0} \quad \text{l'Hospital's again}$$

$$\stackrel{L}{=} \lim_{x \rightarrow 0^+} \frac{e^x}{xe^x + e^x + e^x} \rightarrow \frac{1}{2} \quad \text{stop, no more l'Hospital's Rule}$$

$$= \boxed{\frac{1}{2}}$$

example

$$\lim_{x \rightarrow 0^+} (1+x)^{\cot x} \rightarrow 1^\infty$$

transform into  $\frac{\infty}{\infty}$  or  $\frac{0}{0}$  then use l'Hospital's Rule

$$\lim_{x \rightarrow 0^+} \underbrace{(1+x)^{\cot x}}_y \quad \text{so we want } \lim_{x \rightarrow 0^+} y$$

$$\begin{aligned} \ln y &= \ln (1+x)^{\cot x} \\ &= \cot x \cdot \ln(1+x) = \frac{\ln(1+x)}{\tan x} \end{aligned}$$

$$\text{now note } \lim_{x \rightarrow 0^+} \ln y = \lim_{x \rightarrow 0^+} \frac{\ln(1+x)}{\tan x} \rightarrow \frac{0}{0} \quad \text{l'Hospital's is applicable here}$$

$$\underline{\lim_{x \rightarrow 0^+} \ln y} = \lim_{x \rightarrow 0^+} \frac{\ln(1+x)}{\tan x} \rightarrow \frac{0}{0}$$

$$\stackrel{L}{=} \lim_{x \rightarrow 0^+} \frac{1}{\sec^2 x} \rightarrow \frac{1}{1}$$

Stop, no more  
l'Hospital's Rule

$$= 1$$

we are not done! we found  $\lim_{x \rightarrow 0^+} \ln y$  but we want

$$\lim_{x \rightarrow 0^+} y$$

$$\lim_{x \rightarrow 0^+} \ln y = 1 \quad \text{and} \quad e^{\ln y} = y$$

$$\lim_{x \rightarrow 0^+} e^{\ln y} = e^1 \rightarrow \lim_{x \rightarrow 0^+} y = \boxed{e}$$

example

$$\lim_{x \rightarrow \infty} x^2 \left( \frac{1}{x} - \sin \frac{1}{x} \right) \rightarrow \infty \cdot 0$$

transform into  $\frac{0}{0}$  or  $\frac{\infty}{\infty}$  then use l'Hospital's Rule

$$\lim_{x \rightarrow \infty} x^2 \left( \frac{1}{x} - \sin \frac{1}{x} \right)$$

$$= \lim_{x \rightarrow \infty} \frac{\frac{1}{x} - \sin \frac{1}{x}}{\frac{1}{x^2}} \rightarrow \frac{0}{0}$$

$$\stackrel{L}{=} \lim_{x \rightarrow \infty} \frac{-\frac{1}{x^2} - \left( \cos \frac{1}{x} \right) \left( -\frac{1}{x^2} \right)}{-\frac{2}{x^3}}$$

$$a \cdot b = \frac{b}{\frac{1}{a}} = \frac{b \cdot a}{\frac{1}{a} \cdot a} = \frac{ab}{1} = ab$$

$$\frac{1}{x^2} = x^{-2}$$

$$\frac{d}{dx} \left( \frac{1}{x^2} \right) = -2x^{-3}$$

$$= \lim_{x \rightarrow \infty} \frac{-\frac{1}{x^2} - \cos\left(\frac{1}{x}\right)\left(-\frac{1}{x^2}\right)}{-\frac{2}{x^3}} \cdot \frac{-x^2}{-x^2}$$

$$= \lim_{x \rightarrow \infty} \frac{1 - \cos\left(\frac{1}{x}\right)}{\frac{2}{x}} \rightarrow \frac{0}{0} \quad \text{l'Hospital's Rule again}$$

$$\stackrel{L}{=} \lim_{x \rightarrow \infty} \frac{-\sin\left(\frac{1}{x}\right)\left(-\frac{1}{x^2}\right)}{-\frac{2}{x^2}} = \lim_{x \rightarrow \infty} \frac{\left(-\frac{1}{x^2}\right)\left(\sin\frac{1}{x}\right)}{-\frac{2}{x^2}} \cdot \frac{-x^2}{-x^2}$$

$$= \lim_{x \rightarrow \infty} \frac{\sin\left(\frac{1}{x}\right)}{2} \rightarrow \frac{0}{2} \quad \text{Stop, no more l'Hospital's Rule}$$

$$= \boxed{0}$$

example  
 $\lim_{x \rightarrow 0} \frac{e^x - 1}{x} = \frac{1-1}{0} = \frac{0}{0}$  L'Hôpital's rule  
 $\lim_{x \rightarrow 0} \frac{e^x}{1} = \frac{e^0}{1} = 1$  ✓  
other indeterminate form:  $\infty - \infty$ ,  $\infty \cdot 0$ ,  $0 \cdot \infty$   
as  $x \rightarrow \infty$ ,  $\frac{1}{x} \rightarrow 0$   
so the limit appears to go to  $0 \cdot \infty$   
what it turns out to be depends on how  
big these  $\infty$ 's are relative to each other  
we can use L'Hôpital's rule by turning  $\infty \cdot 0$  into  
 $\frac{0}{0}$  or  $\frac{\infty}{\infty}$

example  
 $\lim_{x \rightarrow \infty} \left( \frac{1}{x} - \frac{1}{e^x} \right)$   
 $\lim_{x \rightarrow \infty} \left[ \frac{e^x - 1}{x(e^x - 1)} \right] = \lim_{x \rightarrow \infty} \frac{e^x - 1}{x(e^x - 1)} \rightarrow \frac{0}{0}$  ✓  
 $\lim_{x \rightarrow \infty} \frac{e^x}{x} = \lim_{x \rightarrow \infty} \frac{e^x}{x^2} = \frac{0}{0}$  ✓  
 $\lim_{x \rightarrow \infty} \frac{e^x}{x^2} = \frac{0}{0}$  ✓

example  
 $\lim_{x \rightarrow 0} \frac{e^x - 1}{x} = \frac{1-1}{0} = \frac{0}{0}$  ✓  
 $\lim_{x \rightarrow 0} \frac{e^x}{1} = \frac{e^0}{1} = 1$  ✓

example  
 $\lim_{x \rightarrow 0} x^2(2 - \cos 2) = 0 \cdot 0 = 0$  (by  $\#3$ ) (same as  $\#1$ ) ✓  
again, sometimes change to  $\frac{0}{0}$  or  $\frac{\infty}{\infty}$   
 $\lim_{x \rightarrow 0} \frac{2 - \cos 2}{x} = \frac{0}{0}$  ✓  
 $\lim_{x \rightarrow 0} \frac{-2x - \sin 2}{1} = \frac{0 - \sin 2}{1} = -\sin 2$  ✓  
clean up =  $6 \cdot 6$   
 $\lim_{x \rightarrow 0} \frac{-2x(1 - \cos 2)}{-2x} = \frac{-2x}{-2x} = \frac{1 - \cos 2}{2x} \rightarrow \frac{0}{0}$  ✓  
 $\lim_{x \rightarrow 0} \frac{(1 - \cos 2)(1 + \cos 2)}{2x} = \lim_{x \rightarrow 0} \frac{1 - \cos^2 2}{2x} = \frac{0}{0}$  ✓  
 $\lim_{x \rightarrow 0} \frac{(1 + \cos 2)(1 - \cos 2)}{2x} = \lim_{x \rightarrow 0} \frac{1 - \cos^2 2}{2x} = \frac{0}{0}$  ✓  
example  
 $\lim_{x \rightarrow 0} \frac{\cos x}{x} = \frac{1}{0} = \infty$  ✓  
again, sometimes turn into  $\frac{0}{0}$  or  $\frac{\infty}{\infty}$   
let  $y = \cos x$   
 $\lim_{x \rightarrow 0} y = \lim_{x \rightarrow 0} \cos x = 1$  ✓  
note  $\lim_{x \rightarrow 0} \frac{1}{x} = \lim_{x \rightarrow 0} \frac{1}{x} = \frac{0}{0}$  ✓
