## Inequalities

Inequalities can be expressed in three different ways.

1. Using an inequality symbol $(<,>, \leq$, or $\geq)$
2. Using a number line graph
3. Using interval notation

## A Comparison of All Three Methods

| Inequality Symbol | Number Line Graph | Interval Notation |
| :---: | :---: | :---: |
| $x<2$ | $\longrightarrow$ | $(-\infty, 2)$ |
| $x>-3$ | $\longleftrightarrow$ | $(-3, \infty)$ |
| $x \leq 0$ | $\longrightarrow \underset{0}{\longrightarrow}$ | $(-\infty, 0]$ |
| $x \geq-5$ | $\stackrel{\bullet}{\longleftrightarrow}$ | $[-5, \infty)$ |
| $2<x<9$ | $\longmapsto_{2}$ | $(2,9)$ |
| $-3 \leq x<2$ |  | $[-3,2)$ |
| $5<x \leq 8$ | $\stackrel{0}{\mathrm{~L}} \stackrel{8}{\longrightarrow}$ | $(5,8]$ |
| $2 \leq x \leq 4$ | $\stackrel{\bullet}{\longleftrightarrow}$ | [2,4] |
| No numbers or No solution |  | $\varnothing$ |
| All numbers | $\longrightarrow$ | $(-\infty, \infty)$ |

A parenthesis is the same as an 'open circle' and a bracket is the same as a 'closed circle' on a number line.

When writing with interval notation, always write the smaller value first. A parenthesis means the value of $x$ can become very close to that number, but will never exactly equal that number. A bracket means the value of $x$ can equal that number. Never use a bracket with positive or negative infinity.
