**64.** Examine  $r$  when  $\theta = 0$  and as  $\theta \rightarrow 90^\circ$

- A.  $r = 1$  when  $\theta = 0$  and as  $\theta \rightarrow 90^\circ$   $r \rightarrow 2$ , looks right as the angle changes from  $0^\circ$  to  $90^\circ$ .
- B.  $r = 2$  when  $\theta = 0$  and as  $\theta \rightarrow 90^\circ$   $r \rightarrow 1$ , looks incorrect as the angle changes from  $0^\circ$  to  $90^\circ$ .  
The radial distance should be getting bigger.
- C.  $r = 1$  when  $\theta = 0$  and as  $\theta \rightarrow 90^\circ$   $r \rightarrow 0$ , looks incorrect as the angle changes from  $0^\circ$  to  $90^\circ$ .  
The radial distance should be getting bigger.
- D.  $r = 2$  when  $\theta = 0$  and as  $\theta \rightarrow 90^\circ$   $r \rightarrow 0$ , looks incorrect as the angle changes from  $0^\circ$  to  $90^\circ$ .  
The radial distance should be getting bigger.
- E.  $r = 0$  when  $\theta = 0$  and as  $\theta \rightarrow 90^\circ$   $r \rightarrow 2$ , looks incorrect as the angle changes from  $0^\circ$  to  $90^\circ$ .  
When the angle is zero the radial distance should greater than zero.

Plugging in further angles would yield more points that will confirm that **A** is the correct polar equation.

$$r^2 = (-2)^2 + 3^2$$

$$r = \sqrt{13}$$

$$\tan \theta = \frac{y}{x} = \frac{3}{-2} \Rightarrow \tan^{-1}\left(-\frac{3}{2}\right) \approx -56.301^\circ$$

$$\theta_R = +56.301^\circ$$

$$\theta = 180^\circ - \theta_R \approx 123.7^\circ$$

$$(\sqrt{13}, 123.7^\circ)$$

**66.**

$$x^2 - 2x + y^2 = 0$$

$$x^2 + y^2 - 2x = 0$$

$$r^2 - 2r \cos \theta = 0$$

$$r(r - 2 \cos \theta) = 0$$

$r = 0$ , which is not an equation of the given circle

or  $r = 2 \cos \theta$
