## Quick Check for Factoring Polynomials

|  | Number | Of | Terms |
| :---: | :---: | :---: | :---: |
| CHECK FOR | Two | Three | Four or More |
| Greatest Common Factor |  |  |  |
| Grouping by Pairs |  |  |  |
| Difference of Squares <br> $a^{2}-b^{2}=(a+b)(a-b)$ |  |  |  |
| Perfect Square Trinomial <br> $a^{2}+2 a b+b^{2}=(a+b)^{2}$ <br> $a^{2}-2 a b+b^{2}=(a-b)^{2}$ |  |  |  |
| Grouping method <br> (Product/Sum method) <br> or Reverse FOIL |  |  |  |

## Points to Remember:

1. Always look for a GCF first, no matter how many terms are in the polynomial.
2. A sum of squares is prime (unless there is a GCF).
3. You can only 'insert' the pair of numbers (found when using grouping to factor a trinomial), if the leading coefficient is a 1.
4. Always write a trinomial in descending order (if there is one variable) before trying to factor using grouping or reversing FOIL.
