

## Review for Exam 2

Exam 2 in class on Wed.

Project 1 due Tues 11pm on Blackboard

What if  $W[y_1, y_2](x_0) = 0$  ?

$$y'' + P y' + Q y = 0$$

$P, Q$  cont.

$$\det \underbrace{\begin{bmatrix} y_1(x_0) & y_2(x_0) \\ y_1'(x_0) & y_2'(x_0) \end{bmatrix}}_A = 0$$

Then there are not both zero  $c_1, c_2$  that solve

$$A \begin{pmatrix} c_1 \\ c_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$y = (c_1 y_1 + c_2 y_2)(x_0) = 0$$

$$y' = (c_1 y_1' + c_2 y_2')(x_0) = 0$$

Hmmm

$\underbrace{c_1 y_1 + c_2 y_2}_{\equiv 0}$  solves

$$\begin{aligned} y(x_0) &= 0 \\ y'(x_0) &= 0 \end{aligned} \quad \leftarrow y \equiv 0 \text{ solves this too!}$$

E: U Thm

says

$y_1, y_2$  are linearly dependent !

# MA 266 Practice problems for Exam 2 sol's

On which interval is the initial value problem

$$\begin{cases} (5-t)y'' + (t-4)y' + 2y = \ln t \\ y(2) = 8 \end{cases}$$

guaranteed to have a unique solution?

Standard Form:  $y'' + \underbrace{\frac{t-4}{t-5}}_{P(t)} y' + \underbrace{\frac{1}{t-5}}_{Q(t)} y = \underbrace{\frac{\ln t}{t-5}}_{R(t)}$

The largest interval containing  $x_0=2$  on which  $P(t)$ ,  $Q(t)$ , and  $R(t)$  are all continuous is  $(0,5)$ .

Find the general solution of the differential equation

$$y'' - 10y' + 27y = 0$$

$$r^2 - 10r + 27 = 0 \quad \text{Roots: } r = \frac{10 \pm \sqrt{100 - 108}}{2} = 5 \pm i\sqrt{2}$$

$$\underline{y = c_1 e^{5t} \cos \sqrt{2}t + c_2 e^{5t} \sin \sqrt{2}t}$$

The function  $y_1 = e^x$  is a solution of

$$(x-1)y'' - 2xy' + (x+1)y = 0.$$

If we seek a second solution  $y_2 = e^x v(x)$  by reduction of order, then  $v(x) =$

Standard Form:  $y'' + \underbrace{\left[\frac{-2x}{x-1}\right]}_{P(x)} y' + \left[\frac{x+1}{x-1}\right] y = 0$

$y_1 = e^x$  is one sol'n.

$y_2 = v y_1$  where  $v' = \frac{1}{y_1^2} e^{-\int P(x) dx}$

$$\begin{aligned}
 v' &= \frac{1}{(e^x)^2} e^{-\int \frac{-2x}{x-1} dx} \\
 &= e^{-2x} e^{2 \int \frac{x-1+1}{x-1} dx} \quad \leftarrow \text{or do long division } x-1 \overline{) x} \\
 &= e^{-2x} e^{2 \int 1 + \frac{1}{x-1} dx} \\
 v' &= e^{-2x} e^{2(x + \ln|x-1|)} = e^{\ln|x-1|^2} = (x-1)^2
 \end{aligned}$$

$$\text{So } v = \int (x-1)^2 dx = \underline{\frac{1}{3}(x-1)^3} \quad \text{and}$$

$$y_2 = v y_1 = \underline{\frac{1}{3}(x-1)^3 e^x}$$

By the Method of Undetermined Coefficients, which of the following  $Y$  is the correct form of a particular solution to the equation

$$L[y] = y^{(4)} - 3y^{(3)} + 2y^{(2)} = 4t - e^t + 3e^{3t}?$$

$$\begin{aligned}
 F_1(t) &= 4t \\
 F_2(t) &= -e^t \\
 F_3(t) &= 3e^{3t}
 \end{aligned}$$

$$\text{Homog sol}^n: r^4 - 3r^3 + 2r^2 = 0$$

$$r^2(r^2 - 3r + 2) = 0$$

$$r^2(r-2)(r-1) = 0$$

$$\begin{array}{c}
 \underbrace{1}_{e^{0t}} \quad \underbrace{t}_{te^{0t}} \quad \underbrace{e^t}_{e^t} \quad \underbrace{e^{2t}}_{e^{2t}} \\
 \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \\
 r = 0, 0, 1, 2
 \end{array}$$

$$\text{Gen}^l \text{ sol}^n \text{ homog}: y = c_1 + c_2 t + c_3 e^t + c_4 e^{2t}$$

$$\text{Particular sol}^n \quad y_p = y_{p1} + y_{p2} + y_{p3} \quad \text{where } L[y_{pj}] = F_j$$

$$y_p = \underbrace{t^2 [A_1 t + A_0]}_{\text{because } 1, t \text{ solve homog}} + \underbrace{t [B e^t]}_{\text{because } e^t \text{ solves homog}} + [C e^{3t}]$$

because  $1, t$  solve homog      because  $e^t$  solves homog

Which of the following is the correct form of a particular solution to the equation

$$L[y] = y^{(4)} - y = \underline{2 + 3te^{-t} + 2\sin t} \quad ?$$

$$\begin{cases} F_1(t) = 2 \\ F_2(t) = 3te^{-t} \\ F_3(t) = 2\sin t \end{cases}$$

$$\text{Homog sol}^n: r^4 - 1 = 0$$

$$(r^2 - 1)(r^2 + 1) = 0$$

$$(r-1)(r+1)(r^2+1) = 0$$

$$r = 1, -1, \pm i$$

 $e^t$   
↓

 $e^{-t}$   
↓

 $\cos t, \sin t$ 

$$y = c_1 e^t + c_2 e^{-t} + c_3 \cos t + c_4 \sin t$$

$$y_p = y_{p1} + y_{p2} + y_{p3} \quad \text{where } L[y_{p_j}] = F_j(t)$$

$$y_p = [A] + \underbrace{t[(B_1 t + B_0)e^{-t}]}_{\text{because } Be^{-t} \text{ solves homog}} + \underbrace{t[C \cos t + D \sin t]}_{\text{because } \cos t \text{ and } \sin t \text{ solve homog}}$$

because  $Be^{-t}$  solves homog

because  $\cos t$  and  $\sin t$  solve homog

Find the solution of the initial value problem

$$y'' + y' - 6y = 0, \quad y(0) = 0, \quad y'(0) = 5.$$

$$r^2 + r - 6 = 0$$

$$(r+3)(r-2) = 0 \quad r = 2, -3$$

$$y = c_1 e^{2x} + c_2 e^{-3x}$$

$$y' = 2c_1 e^{2x} - 3c_2 e^{-3x}$$

$$\begin{cases} y(0) = c_1 + c_2 = 0 \\ y'(0) = 2c_1 - 3c_2 = 5 \end{cases}$$

want

$\leftarrow c_2 = -c_1$

$$2c_1 - 3(-c_1) = 5$$

$$\boxed{\begin{matrix} c_1 = 1 \\ c_2 = -1 \end{matrix}}$$

$$y = \underline{e^{2x} - e^{-3x}}$$

A spring-mass system set in motion was determined by the initial value problem

$$u'' + 100u = 0, \quad u(0) = 1, \quad u'(0) = -10.$$

What is the amplitude of the motion?

$$\begin{array}{l|l} r^2 + 100 = 0 & u = c_1 \cos 10t + c_2 \sin 10t \\ r = \pm 10i & u' = -10c_1 \sin 10t + 10c_2 \cos 10t \end{array} \quad \left| \begin{array}{l} u(0) = c_1 = 1 \\ u'(0) = 10c_2 = -10 \end{array} \right.$$

$$\boxed{\begin{array}{l} c_1 = 1 \\ c_2 = -1 \end{array}}$$

$$u = c_1 \cos 10t + c_2 \sin 10t = A \cos(10t - \phi)$$

$$\text{where } A = \text{Amplitude} = \sqrt{c_1^2 + c_2^2} = \sqrt{(1)^2 + (-1)^2} = \underline{\underline{\sqrt{2}}}$$

An undamped, free vibration  $u'' + 9u = 0$  has initial conditions  $u(0) = 4, u'(0) = 9$ . The solution of this initial value problem can be written as  $u = R \cos(\omega t - \delta)$ . What are  $R$  and  $\delta$ ?

$$\begin{array}{l|l} u = c_1 \cos 3t + c_2 \sin 3t & u(0) = c_1 = 4 \\ u' = -3c_1 \sin 3t + 3c_2 \cos 3t & u'(0) = 3c_2 = 9 \end{array} \quad \left| \begin{array}{l} c_1 = 4 \\ c_2 = 3 \end{array} \right.$$

$$u = c_1 \cos 3t + c_2 \sin 3t = \underbrace{\sqrt{c_1^2 + c_2^2}}_R \left( \underbrace{\frac{c_1}{\sqrt{c_1^2 + c_2^2}}}_{\cos \delta} \cos 3t + \underbrace{\frac{c_2}{\sqrt{c_1^2 + c_2^2}}}_{\sin \delta} \sin 3t \right)$$

$$= R \cos(3t - \delta) \quad \text{where } R = \sqrt{4^2 + 3^2} = \underline{\underline{5}}$$

$$\text{and } \delta = \underline{\underline{\tan^{-1} \frac{3}{4}}}$$

A spring system with external forcing term is represented by the equation

$$y'' + 2y' + 2y = 4\cos(t) + 2\sin(t).$$

Then the steady state solution of the system is given by

Homog sol<sup>n</sup> is  $c_1 e^{-t} \cos t + c_2 e^{-t} \sin t$  is transient.

Steady state sol<sup>n</sup> =  $y_p = A \cos t + B \sin t$

$$y_p' = -A \sin t + B \cos t$$

$$y_p'' = -A \cos t - B \sin t$$

Plug into ODE:  $[-A \cos t - B \sin t] + 2[-A \sin t + B \cos t] + 2[A \cos t + B \sin t]$

$$= \underbrace{[-A + 2B + 2A]}_{\text{want} = 4} \cos t + \underbrace{[-B - 2A + 2B]}_{= 2} \sin t$$

$$\begin{cases} A + 2B = 4 & \leftarrow 2A + 4B = 8 \\ -2A + B = 2 & \rightarrow \underline{-2A + B = 2} \end{cases} \quad \begin{aligned} A &= 4 - 2B \\ &= 4 - 2 \cdot 2 = 0 \\ \underline{\underline{A}} &= \underline{\underline{0}} \end{aligned}$$

$$\begin{aligned} 5B &= 10 \\ \underline{\underline{B}} &= \underline{\underline{2}} \end{aligned}$$

Steady state sol<sup>n</sup> =  $0 \cdot \cos t + 2 \cdot \sin t = \underline{\underline{2 \sin t}}$

The homogeneous differential equation  $t^2 y'' - 4ty' + 6y = 0$  ( $t > 0$ ) has two solutions given by  $y_1(t) = t^2$  and  $y_2(t) = t^3$ . Using the method of Variation of Parameters, find the general solution of the nonhomogeneous equation  $t^2 y'' - 4ty' + 6y = t^3$ .

Standard Form!  $y'' + \left[-\frac{4}{t}\right]y' + \left[\frac{6}{t^2}\right]y = \underbrace{t}_{F(t)}$

$$W = W[y_1, y_2] = \det \begin{bmatrix} t^2 & t^3 \\ 2t & 3t^2 \end{bmatrix} = 3t^4 - 2t^4 = t^4$$

$$y_p = u_1 y_1 + u_2 y_2 \quad \text{where} \quad \begin{array}{l|l} u_1' = \frac{-y_2 F}{W} & u_2' = \frac{y_1 F}{W} \\ u_1' = \frac{-t^3 \cdot t}{t^4} = -1 & u_2' = \frac{t^2 \cdot t}{t^4} = \frac{1}{t} \end{array}$$

So  $\underline{u_1 = -t} \quad \underline{u_2 = \ln|t|}$

$$y_p = u_1 y_1 + u_2 y_2 = (-t) \cdot t^2 + (\ln|t|) \cdot t^3$$

$$\text{Gen}^l \text{ sol}^n \text{ to } (*) : \underline{y = c_1 t^2 + c_2 t^3 + (-1 + \ln|t|) t^3}$$

Find the general solution of

$$y^{(4)} - 10y'' + 9y = 0.$$

$$r^4 - 10r^2 + 9 = 0$$

$$(r^2 - 9)(r^2 - 1) = 0$$

$$(r-3)(r+3)(r-1)(r+1) = 0 \quad r = \pm 1, \pm 3$$

$$\underline{y = c_1 e^x + c_2 e^{-x} + c_3 e^{3x} + c_4 e^{-3x}}$$

or  $C_1 \cosh x + C_2 \sinh x + C_3 \cosh 3x + C_4 \sinh x$

Given that the function  $y_1 = t$  is a solution to the differential equation

$$t^2 y'' - t y' + y = 0, \quad t > 0,$$

choose a function  $y_2$  from the list below so that the pair  $\{y_1, y_2\}$  is a fundamental set of the solutions to the differential equation above.

Standard Form!  $y'' + \underbrace{\left[-\frac{1}{t}\right]}_{P(t) = -\frac{1}{t}} y' + \left[\frac{1}{t^2}\right] y = 0$

$y_2 = v y_1$  where

$$v' = \frac{1}{y_1} e^{-\int P(t) dt}$$

$$= \frac{1}{t^2} e^{-\int -\frac{1}{t} dt}$$

$$= \frac{1}{t^2} e^{\ln|t|} = \frac{|t|}{t^2} = \pm \frac{1}{t}$$

$$v = \int \frac{1}{t} dt = \ln|t|$$

take  $v = +\frac{1}{t}$

$$y_2 = v y_1 = (\ln|t|) \cdot t$$

$$\{y_1, y_2\} = \underline{\{t, t \ln|t|\}}$$
