

14.3 Partial Derivatives

In calculus of 1 variable,

the derivative

$$f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$$

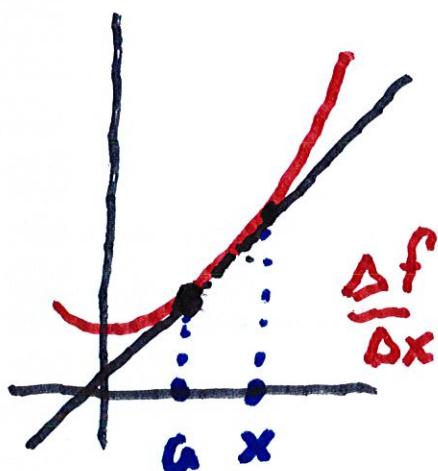

tells how a function $f(x)$

is changing

when x is near a

Now suppose

$f(x, y)$ depends on 2 variables.

How does $f(x,y)$ change when we only allow x to change?

Thus we define

$$f_x(a,b) = \lim_{h \rightarrow 0} \frac{f(a+h, b) - f(a, b)}{h}$$

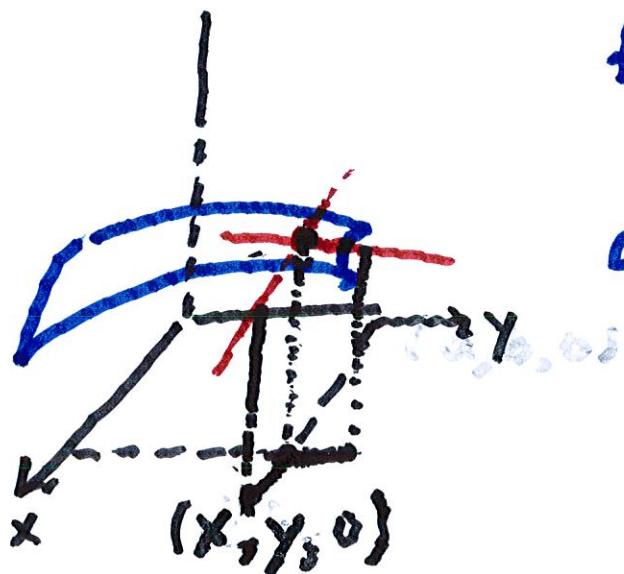

And if we only allow y to change?

$$f_y(a,b) = \lim_{h \rightarrow 0} \frac{f(a, b+h) - f(a, b)}{h}$$

If we now let the point (a, b)
to vary:

$$f_x(x, y) = \lim_{h \rightarrow 0} \frac{f(x+h, y) - f(x, y)}{h}$$

$$f_y(x, y) = \lim_{h \rightarrow 0} \frac{f(x, y+h) - f(x, y)}{h}$$

$f_x(x, y)$ and $f_y(x, y)$
are called
partial derivatives
of f at (x, y)

There are many alternative
notations for

$$f_x(x, y) = f_x = \frac{\partial f}{\partial x} = \frac{\partial}{\partial x} f(x, y)$$

$$= \frac{\partial z}{\partial x} = D_1 f = D_x f$$

and

$$f_y(x, y) = f_y = \frac{\partial f}{\partial y} = \frac{\partial}{\partial y} f(x, y)$$

$$= \frac{\partial z}{\partial y} = D_2 f = D_y f$$

Rule for finding Partial Derivatives

of $z = f(x, y)$

1. To find f'_x , regard y as a

constant and differentiate

$f(x, y)$ with respect to x .

2. To find f'_y , regard x as a

constant and differentiate

$f(x, y)$ with respect to y .

Ex. 1 If $f(x,y) = x^4 + x^2y^3 - 2y^3$

For f_x , keep y constant,

Find $f_x(1,2)$

$$f_x(x,y) = 4x^3 + 2xy^3 = 4 \cdot 1 + 2 \cdot 1 \cdot 8$$

$$= \underline{\underline{20}}$$

For f_y , keep x constant.

Find $f_y(1,2)$

$$f_y(1,2) = 3x^2y^2 - 6y^2 = 3 \cdot 1 \cdot 4 - 6 \cdot 4$$

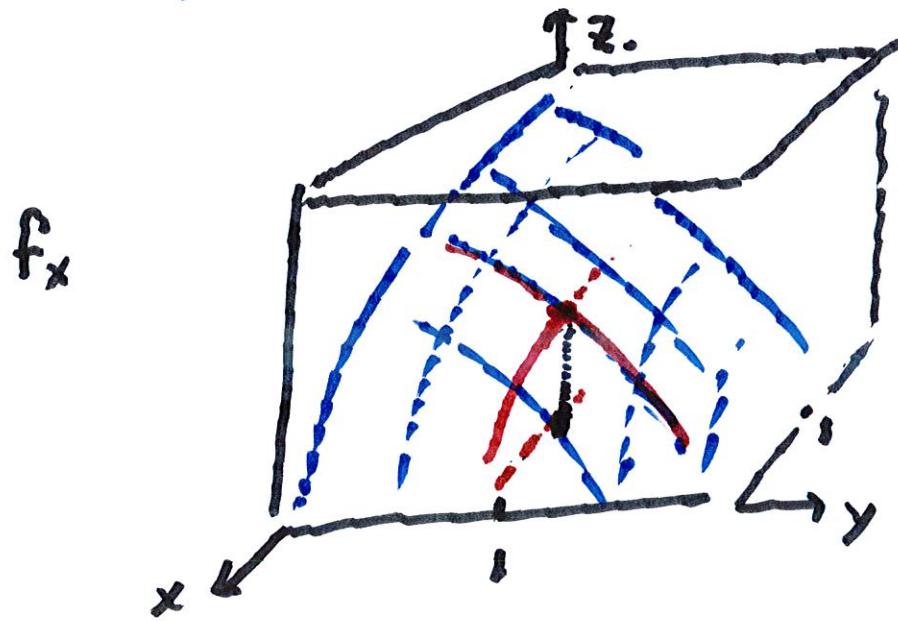

$$= \underline{\underline{-12}}$$

Ex. If $f(x,y) = 4 - x^2 - 2y^2$,

find $f_x(1,1)$ and $f_y(1,1)$.

$$f_x = -2x = -2$$

$$f_y = -4y = -4$$

$f_x(1,1) = -2 = \text{rate of change}$

as x changes at $(1,1)$

Similarly,

$f_y(1,1) = -4$ = rate of changing

at $(1,1)$

we can use all of the rules

for differentiation to

compute $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$.

Compute $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$

$$\text{if } f(x, y) = \cos\left\{\frac{x^2}{1+y^3}\right\}$$

$$\frac{\partial f}{\partial x} = -\sin\left\{\frac{x^2}{1+y^3}\right\} \cdot \frac{2x}{1+y^3}$$

$$\frac{\partial f}{\partial y} = -\sin\left\{\frac{x^2}{1+y^3}\right\} \left(\frac{-x^2}{(1+y^3)^2} \right) 3y^2$$

Use implicit differentiation

to compute $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$

if z is defined implicitly by

$$x^2 + 2y^3 + z^4 - x^2y + z + 1 = 0$$

$$6(z(x))^4 \quad \frac{d}{dx} z(x)$$

First with respect to x :

$$2x + 6y + 4z^3 \frac{\partial z}{\partial x} - 2xy + \frac{dz}{dx} = 0$$

{Always think of z as $z(x, y)$ }

Solve for $\frac{\partial z}{\partial x}$:

$$\frac{\partial z}{\partial x} (1 + 4z^3) = 2xy - 2x$$

$$\therefore \frac{\partial z}{\partial x} = \frac{2xy - 2x}{1 + 4z^3} \quad \left(= \frac{6}{31} \right)$$

~~\equiv~~

at $(1, -2, -2)$

Now with respect to y :

$$6y^2 + 4z^3 \frac{\partial z}{\partial y} - x^2 + \frac{\partial z}{\partial y} = 0$$

11

Solve for $\frac{\partial z}{\partial y}$:

$$\frac{\partial z}{\partial y} \quad \{ 1 + 4z^3 \} = x^2 - 6y^2$$

$$\rightarrow \frac{\frac{\partial z}{\partial x}}{\frac{\partial z}{\partial y}} = \frac{x^2 - 6y^2}{1 + 4z^3} \quad \left(= \frac{23}{31} \right)$$

at $(1, -2, -2)$

The problem is that we

don't know what Z is.

When $x=1$, $y = -2$, then

$z = -2$ is a solution, i.e.,

$$z(1, -2) = -2$$

For functions of 3 variables:

$$f_x(x, y, z) = \lim_{h \rightarrow 0} \frac{f(x+h, y, z) - f(x, y, z)}{h}$$

To differentiate, keep y and z

fixed.

Ex. If $f(x, y, z) = \frac{xy^2}{x+y+z}$,

find $\frac{\partial f}{\partial x}$, $\frac{\partial f}{\partial y}$, and $\frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial x} = \frac{(x+y+z)y^2 - xy^2 \cdot 1}{(x+y+z)^2}$$

$$\frac{\partial f}{\partial y} = \frac{(x+y+z)2xy - xy^2 \cdot 1}{(x+y+z)^2}$$

$$\frac{\partial f}{\partial z} = \frac{-xy^2}{(x+y+z)^2}$$

Ex. Find the first derivatives

of $w = x^{\frac{y}{z}}$, if x, y, z
are > 0

13.1

Recall $\frac{d}{dx} (x^t) = t x^{t-1}$

$$\therefore \frac{\partial}{\partial x} (x^{\frac{y}{z}}) = \left(\frac{y}{z}\right) \cdot x^{\frac{y}{z}-1}$$

Also, $\frac{\partial}{\partial y} (x^{\frac{y}{z}}) = (\ln x) x^{\frac{y}{z}} \cdot \frac{1}{z}$

and $\frac{\partial}{\partial z} (x^{\frac{y}{z}}) = (\ln x) x^{\frac{y}{z}} \cdot \left(-\frac{x}{z^2}\right)$

We used $\frac{d}{dt} (x^t) = (\ln x) x^t$

Ex. Find first derivatives

$$\text{if } w = x^{(y/z)}$$

$$x = e^{\ln x}$$

$$\therefore x^{(y/z)} = \left\{ e^{\ln x} \right\}^{y/z}$$

$$= e^{\frac{y \ln x}{z}}$$

$$\therefore \frac{\partial w}{\partial x} = \frac{\partial}{\partial x} \left\{ e^{\frac{y \ln x}{z}} \right\}$$

$$= e^{\frac{y \ln x}{z}} \cdot \frac{y}{xz}$$

$$\frac{\partial w}{\partial y} = \frac{\partial}{\partial y} \left\{ e^{\frac{y \ln x}{z}} \right\}$$

$$= e^{\frac{y \ln x}{z}} \cdot \frac{\ln x}{z}$$

$$\frac{\partial w}{\partial z} = \frac{\partial}{\partial z} \left\{ e^{\frac{y \ln x}{z}} \right\}$$

$$= e^{\frac{y \ln x}{z}} \cdot \left\{ -\frac{y \ln x}{z^2} \right\}$$

Higher Derivatives

If $z = f(x, y)$, then

$$\{f_x\}_x = f_{xx} = f_{11} = \frac{\partial}{\partial x} \left\{ \frac{\partial f}{\partial x} \right\}$$

$$= \frac{\partial^2 f}{\partial x^2} = \underline{\underline{\frac{\partial^2 z}{\partial x^2}}}$$

Similar formulas for $\{f_x\}_y$

$$\{f_x\}_y = f_{xy} = \frac{\partial}{\partial y} \left\{ \frac{\partial f}{\partial x} \right\}$$

$$f_{12} = \frac{\partial^2 f}{\partial y \partial x} = \underline{\underline{\frac{\partial^2 z}{\partial y \partial x}}}$$

Ex. If $f(x, y) = x^3 + x^2y^4 + 3y^2$

$$f_x = 3x^2 + 2xy^4$$

$$\{f_x\}_y = 8xy^3$$

$$f_y \quad \{f_x\}_x = 6x + 2y^4$$

$$f_y = 4x^2y^3 + 6y$$

$$\{f_y\}_x = 8xy^3$$

$$\{f_y\}_y = 12x^2y^2 + 6$$

Note that

$$\{f_x\}_y = xy^3 = \{f_y\}_x$$

Thm. If f_{xy} and f_{yx} are

continuous in a disk D , then

$$f_{xy} = f_{yx}$$

Ex. Compute f_{xyz} if

$$f(x,y,z) = x^2y - y^2z^3x^2$$

$$f_x = 2xy - 2x^2yz^3$$

$$f_{xy} = 2x - 4xyz^3$$

$$f_{xyz} = -12xyz^2$$
