

Lessons 24-26: Optimization

Optimization Problems: Often this includes finding the maximum or minimum value of some function.

- e.g. The minimum time to make a certain journey,
- The minimum cost for constructing some object,
- The maximum profit to gain for a business, and so on.

How do we solve an optimization problem?

- Determine a function (**known as objective function**) that we need to maximize or minimize.
- Determine if there are some constraints on the variables. (The equations that describe the constraints are called **the constraint equations**.)
 - If there are constraint equations, rewrite the **objective function** as a function of only one variable.
- Then we can solve for absolute maximum or minimum like we did before.

↳ via the 1st/2nd Derivative Test

This space is left for you to take your own notes.

Recipe for Solving an Optimization Problem

Step 1: Identify what quantity you are trying to optimize.

Step 2: Draw a picture (if applicable), corresponding to the problem, and label it with your variables.

Step 3: Express the variable to be optimized as a function of the variables you used in Step 2.

Step 4: Find relations among the variables from Step 2 and express the variable to be optimized a function of just one of the variables from Step 2.

Step 5: Identify the domain for the function you found in Step 4.

Step 6: Find the absolute maximum of the variable to be optimized on this domain.

m: n

Step 7: Reread the question and be sure you have answered exactly what was asked.

This space is left for you to take your own notes.

⑤ Be careful w/ () or []

e.g. No negatives for \$\$ or
lengths

Example 2: Of all the numbers whose sum is 50, find the two that have the maximum product.

Let x and y be such #s.

① Product

② None

③ $P = xy$

④ $x + y = 50$

⑤ Domain x and y :
 $(-\infty, \infty)$

⑥ Solve ④ for y .

$$y = 50 - x$$

Plug y into ③

$$\begin{aligned} P &= x(50 - x) \\ &= 50x - x^2 \end{aligned}$$

Take the derivative
set $= 0$.

$$\begin{aligned} P' &= 50 - 2x = 0 \\ x &= 25 \end{aligned}$$

Check that $x = 25$
gives abs max.

Since you have no
endpts, use 2nd
Derivatives.

$$\begin{aligned} P'' &= -2 < 0 \\ &\Rightarrow \text{abs max} \end{aligned}$$

$$\textcircled{7} x = 25$$

$$y = 50 - x = 25$$

Example 3: A carpenter is building a rectangular room with a fixed perimeter of 54 feet. What are the dimensions of the largest room that can be built? What is its area?

① Area A

③ $A = xy$

④ $54 = P = 2x + 2y$
 $27 = x + y$

⑤ Domain x and y : $(0, 27)$

$x, y = 0 \Rightarrow$ no length

$$27 = 0 + y$$

$y = 27 \Rightarrow$ no width

⑥ Solve ④ for y .

$$y = 27 - x$$

Plug y into ③.

$$A = x(27 - x)$$
$$= 27x - x^2$$

Take derivative of

A set $= 0$.

$$A' = 27 - 2x = 0$$

$$x = 27/2$$

$$A'' = -2 < 0 \Rightarrow \text{abs max}$$

⑦ $x = 27/2$

$$y = 27/2$$

$$A = \frac{729}{4}$$

Example 4: An open-top box with a square base is to have a volume of 8 cubic feet. Find the dimensions of the box that can be made with the least amount of material.

① Surface Area

③ $SA = x^2 + 4xy$

④ $8 = V = x^2y$

⑤ Domain x and y:
 $(0, \infty)$

⑥ Solve ④ for y.

$$y = \frac{8}{x^2}$$

Plug y into ③.

$$SA = x^2 + 4x \left(\frac{8}{x^2} \right)$$

$$= x^2 + \frac{32}{x}$$

$$= x^2 + 32x^{-1}$$

Take derivative of SA set = 0.

$$(SA)' = 2x - 32x^{-2} = 0$$

$$2x - \frac{32}{x^2} = 0$$

$$\frac{2x}{1} = \frac{32}{x^2}$$

$$2x^3 = 32$$

$$x^3 = 16$$

$$x = 2 \cdot \sqrt[3]{2}$$

Check abs min

$$(SA)'' = 2 - 32(-2)x^{-3}$$

$$= 2 + \frac{64}{x^3}$$

$$(SA)''(2 \cdot \sqrt[3]{2}) = 2 + \frac{64}{16} > 0$$

\Rightarrow abs min

⑦ $x = 2 \cdot \sqrt[3]{2}$

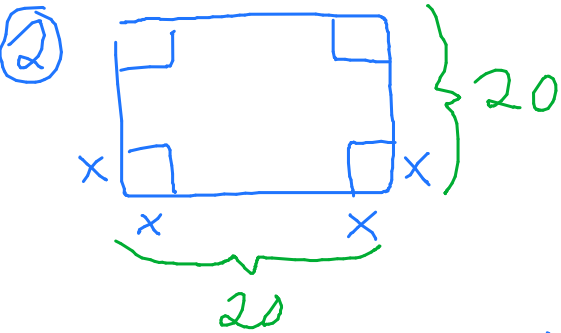

$$y = \frac{8}{(2 \cdot \sqrt[3]{2})^2} = \sqrt[3]{2}$$

$$2 \cdot \sqrt[3]{2} \times 2 \cdot \sqrt[3]{2} \times \sqrt[3]{2}$$

l w h

Example 1: From a thin piece of cardboard 20 in by 20 in, square corners are cut out so that the sides can be folded up to make a box. What dimensions will yield a box of maximum volume? What is the maximum volume?

① Volume

③ $V = x(20-2x)^2$

④ No constraints

⑤ Domain of x : $(0, 10)$

$x=0 \Rightarrow$ no height
 $20-2x=0 \Rightarrow$ no width
 $x=10$

⑥ $V = x(400 - 80x + 4x^2)$
 $= 400x - 80x^2 + 4x^3$
 $V' = 400 - 160x + 12x^2 = 0$
 $4(100 - 40x + 3x^2) = 0$
 $4(10 - 3x)(10 - x) = 0$
 $x = \frac{10}{3}, 10$
 by ⑤

$V'' = -160 + 24x$

$V''(\frac{10}{3}) = -80 < 0 \Rightarrow$ abs max

⑦ $x = 10/3$
 $20 - 2x = 40/3$

Dimensions

$\frac{10}{3} \times \frac{40}{3} \times \frac{40}{3}$

Volume = $\frac{1600}{27}$

HW 24.6: You are designing a paper with an area of 400 cm^2 to contain a printing area in the middle and have the margins of 2 cm at the top and bottom and 4 cm on each side. Find the largest possible printing area.

① Area

③ $A = xy$

④ $400 = (x+4)(y+8)$

⑤ If $x=0$,

$$400 = (0+4)(y+8)$$

$$400 = 4(y+8)$$

$$100 = y+8$$

$$y = 92$$

If $y=0$

$$400 = (x+4)(0+8)$$

$$400 = 8(x+4)$$

$$50 = x+4$$

$$x = 46$$

Domain $x: (0, 46)$

Domain $y: (0, 92)$

⑥ Solve ④ for y .

$$\frac{400}{x+4} = y+8$$

$$\frac{400}{x+4} - 8 = y$$

Plug y into ③

$$A = x \left(\frac{400}{x+4} - 8 \right)$$

$$= \frac{400x}{x+4} - 8x$$

$$A' = \frac{1600}{(x+4)^2} - 8 = 0$$

$$\frac{1600}{(x+4)^2} = \frac{8}{1}$$

$$8(x+4)^2 = 1600$$

$$(x+4)^2 = 200$$

$$x+4 = \pm 10\sqrt{2}$$

$$x = -4 \pm 10\sqrt{2}$$

↪ b/c ⑤

$$A' = 1600(x+4)^{-2} - 8$$

$$A'' = -3200(x+4)^{-3}$$

HW 24.6: You are designing a paper with an area of 400 cm^2 to contain a printing area in the middle and have the margins of 2 cm at the top and bottom and 4 cm on each side. Find the largest possible printing area.

$$A''(10\sqrt{2}-4) = \frac{-3200}{(10\sqrt{2})^3} < 0 \Rightarrow \text{Max}$$

$$\textcircled{7} \quad x = 10\sqrt{2} - 4$$

$$y = \frac{400}{x+4} - 8 = \frac{400}{10\sqrt{2}-4+4} - 8 = 20\sqrt{2} - 8$$

$$A = xy = (10\sqrt{2}-4)(20\sqrt{2}-8) \approx 206 \text{ cm}^2$$

Example 5: A Norman window is constructed by adjoining a semicircle to the top of an ordinary rectangular window. Find the dimensions of a Norman window of maximum area if the total perimeter is 10 feet.

① Area

③ $A = \frac{1}{2}\pi r^2 + 2rw$

④ $10 = P = \pi r + 2w + 2r$

⑤ If $r=0$, $10 = 2w$
 $w = 5$

If $w=0$, $10 = \pi r + 2r$
 $10 = r(\pi + 2)$
 $r = \frac{10}{\pi + 2}$

Domain r : $(0, \frac{10}{\pi+2})$

Domain w : $(0, 5)$

⑥ Solve ④ for w .

$$10 - 2r - \pi r = 2w$$

$$\frac{10 - 2r - \pi r}{2} = w$$

Plug w into ③

$$A = \frac{1}{2}\pi r^2 + 2r \left(\frac{10 - 2r - \pi r}{2} \right)$$

$$A = \frac{1}{2}\pi r^2 + 10r - 2r^2 - \pi r^2$$

$$A' = \frac{2\pi r}{2} + 10 - 4r - 2\pi r$$

$$= \pi r + 10 - 4r - 2\pi r$$

$$= 10 - 4r - \pi r$$

$$= 10 - r(4 + \pi) = 0$$

$$10 = r(4 + \pi)$$

$$r = \frac{10}{4 + \pi}$$

$$A'' = -(4 + \pi) < 0 \Rightarrow \text{max}$$

⑦ $r = \frac{10}{4 + \pi}$

$$w = \frac{10}{4 + \pi}$$

Example 6: A rectangular box is to have a square base and a volume of 800 ft^3 . If the material for the base costs \$2 per square foot, the material for the sides costs \$4 per square foot, and the material for the top costs \$1 per square foot, determine the minimum cost for constructing such a box.

① Cost, C

③ $C = 2(x^2) + 4(4xy) + 1(x^2)$
 $= 3x^2 + 16xy$

④ $800 = V = x^2 y$

⑤ Domain x & y :
 $(0, \infty)$

⑥ Solve ④ for y .
 $\frac{800}{x^2} = y$

Plug y in ③.

$$C = 3x^2 + 16x \left(\frac{800}{x^2} \right)$$

$$= 3x^2 + \frac{16(800)}{x}$$

$$= 3x^2 + 12800x^{-1}$$

$$C' = 6x - 12800x^{-2} = 0$$

$$6x - \frac{12800}{x^2} = 0$$

$$\frac{6x}{1} = \frac{12800}{x^2}$$

$$6x^3 = 12800$$

$$x^3 = 6400/3$$

$$x = 4 \cdot \sqrt[3]{100/3}$$

$$C'' = 6 + 25600x^{-3}$$

$$= 6 + \frac{25600}{x^3}$$

$$C''(4 \cdot \sqrt[3]{100/3}) > 0$$

$$\Rightarrow \text{min}$$

⑦ $x = 4 \cdot \sqrt[3]{100/3}$

$$y = \frac{800}{16(100/3)^{2/3}}$$

$$C = \$62.14$$

Example 7: A company's marketing department has determined that if their product is sold at the price of p dollars per unit, they can sell $q = 2400 - 200p$ units. Each unit costs \$5 to make.

1. What price, p , should the company charge to maximize their revenue?

Example 7: A company's marketing department has determined that if their product is sold at the price of p dollars per unit, they can sell $q = 2400 - 200p$ units. Each unit costs \$5 to make.

2. What price, p , should the company charge to maximize their profit?

Example 8: Find the point on the graph of $f(x) = 2x + 4$ that is the closest to the point $(1,3)$.

HW 25.4: For a cylinder with a surface area of 20, what is the maximum volume that it can have? Recall that the volume of a cylinder is $\pi r^2 h$ and the surface area is $2\pi r h + 2\pi r^2$ where r is the radius and h is the height.

HW 26.1: A rectangular recreational field needs to be built outside of a gymnasium. Three walls of fencing are needed and the fourth wall is to be a wall of the gymnasium itself. The ideal area for such a field is exactly $490000ft^2$. In order to minimize costs, it is necessary to construct the fencing using the least amount of material possible. Assuming that the material used in the fencing costs \$25/ft, what is the least amount of money needed to build this fence of ideal area?
