

homework #3 problem 11

Courtney Kreef

prove:
 $\triangle ABC \sim \triangle DEF$

Given: $DE \parallel AB$, $DF \parallel AC$, $EF \parallel BC$

- ① $BF \perp$, extend DE , AB , EF , BC ,
 DF , AC to infinite lines
- ② intersection DF w/ $AB = G$
 FE w/ $AB = H$
 DF w/ $BC = I$
- ③ $DE \parallel AB$, $\angle FDE = \angle DGH$ by BFS
- ④ $DF \parallel AC$, parallel lines DE and AB cross it, $\angle CAB = \angle DGH$ by BFS
- ⑤ $\angle FDE = \angle CAB$ by substitution
- ⑥ $AC \parallel DF$, $\angle ACB = \angle FIB$ by BFS (CB = transversal).
- ⑦ $EF \parallel BC$, parallel lines DF and AC cross it, $\angle DFE = \angle FIB$ by BFS
- ⑧ $\angle ACB = \angle DFE$ by substitution
- ⑨ Because $\angle ACB = \angle DFE$, $\angle FDE = \angle CAB$, Theorem 4 tells us
 $\angle ABC = \angle DEF$
- ⑩ Definition of similar triangles, $\triangle ABC \sim \triangle DEF$.
