

When using the normal distribution, choose the nearest  $z$ -value to find the probability, or if the probability is given, choose the nearest  $z$ -value. No interpolation should be used.

Example: If the given  $z$ -value is 0.759, and you need to find  $\Pr(Z < 0.759)$  from the normal distribution table, then choose the probability for  $z$ -value = 0.76 :  $\Pr(Z < 0.76) = 0.7764$ .

Unless specified otherwise, when using the normal approximation to a discrete distribution, use the continuity correction.

### NORMAL DISTRIBUTION TABLE

Entries represent the area under the standardized normal distribution from  $-\infty$  to  $z$ ,  $\Pr(Z < z)$ .

The value of  $z$  to the first decimal is given in the left column. The second decimal is given in the top row.

$z$	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09

$\infty$	0.04879	0.04879	1.02480	0.97600	1.00020	0.50823

## Long Term Actuarial Mathematics Formulas

### Interest Functions

$$\alpha(m) = \frac{id}{i^{(m)}d^{(m)}} \quad \text{and} \quad \beta(m) = \frac{i - i^{(m)}}{i^{(m)}d^{(m)}}$$

### Under Makeham's Law

$$\mu_x = A + Bc^x \quad \text{and} \quad {}_t p_x = \exp\left[-At - \frac{B}{\ln c} c^x (c^t - 1)\right]$$

### Three-Term Woolhouse Formula in a Single Decrement Context

$$\ddot{a}_x^{(m)} \approx \ddot{a}_x - \frac{m-1}{2m} - \frac{m^2-1}{12m^2} (\delta + \mu_x)$$

### Three-Term Woolhouse Formula in a Multiple Decrement Context

$$\ddot{a}_x^{(m)ij} \approx \bar{a}_x^{ij} - \frac{\mu_x^{ij}}{12m^2} \quad i \neq j$$

$$\ddot{a}_x^{(m)ii} \approx \bar{a}_x^{ii} + \frac{1}{2m} + \frac{\mu_x^{i\bullet} + \delta}{12m^2} \quad \text{where } \mu_x^{i\bullet} = \sum_{j \neq i} \mu_x^{ij}$$

The candidate is expected to know how to convert these formulas to the two-term approximations.

### Greenwood's Approximation Formula

$$V[\hat{S}(t)] \approx [\hat{S}(t)]^2 \sum_{j:t_{(j)} \leq t} \frac{d_j}{r_j(r_j - d_j)} \quad \text{for } t < t_{(\max)}$$

### Estimated Variance Formula for Nelson-Aalen Estimator

$$V[\hat{S}(t)] \approx [\hat{S}(t)]^2 \sum_{j:t_{(j)} \leq t} \frac{d_j(r_j - d_j)}{r_j^3} \quad \text{for } t < t_{(\max)}$$
