

For this week, please complete the following tasks:

1. Finalize your analysis of the data. Look for obvious errors in your results. For example, if the probability of death is greater than 1.0021, there is an error in your data. Track it down. Figure out why you have an error. If you find an error, send me a corrected death and exposure files as soon as possible but not later than Wednesday night, November 6 at midnight.
2. Finalize your calculation of expected deaths. Complete the spreadsheet on the website that compares actual deaths to expected deaths for each of your possible categories. Send me that summary spreadsheet no later than Wednesday night at midnight.
3. Begin working on a draft of the report. Please feel free to ask me any questions about the report as you start to work on it.
