October 7th, 2022

**Problem 1.** Use implicit differentiation to find  $\frac{dy}{dx}$  for the following equations

(a)  $2x^4 = 4y^2 + 6x^2$

(b) and  $e^{2xy} = 6x$ .

*Solution:*

(a) We begin by differentiating both sides of the equation with respect to  $x$ ,

$$\begin{aligned}\frac{d}{dx}[2x^4] &= \frac{d}{dx}[4y^2 + 6x^2] \\ 8x^3 &= 8y \frac{dy}{dx} + 12x.\end{aligned}$$

Finally we solve for  $dy/dx$  and see that

$$\frac{dy}{dx} = \frac{8x^3 - 12x}{8y} = \frac{2x^3 - 3x}{2y}.$$

(b) First we differentiate both sides of the equation with respect to  $x$  and obtain

$$\begin{aligned}\frac{d}{dx}[e^{2xy}] &= \frac{d}{dx}[6x] \\ e^{2xy} \frac{d}{dx}[2xy] &= 6 \\ e^{2xy} (2y + 2x \frac{dy}{dx}) &= 6.\end{aligned}$$

Finally, we solve for  $dy/dx$  and hence

$$\frac{dy}{dx} = \frac{3 - ye^{2xy}}{xe^{2xy}}.$$
