# Goals

## Main Objective

Provide a *lingua universalis* for operations and relations in order to understand their structure.

## Internal Applications

- 1 Realize universal constructions (e.g. free, push–forward, pull–back, plus construction, decorated).
- 2 Construct universal transforms. (e.g. bar,co–bar) and model category structure.
- 3 Distill universal operations in order to understand their origin (e.g. Lie brackets, BV operatos, Master equations).
- 4 Construct secondary objects, (e.g. Lie algebras, Hopf algebras).

# Applications

## Applications

- Find out information of objects with operations. E.g. Gromov-Witten invariants, String Topology, etc.
- Find out where certain algebra structures come from naturally: pre-Lie, BV, ...
- Find out origin and meaning of (quantum) master equations
- Find background for certain types of Hopf algebras.
- Find formulation for TFTs.
- Transfer to other areas such as algebraic geometry, algebraic topology, mathematical physics, number theory.

## Operations and relations for Associative Algebras

- Data: An object  $A$  and a multiplication  $\mu : A \otimes A \rightarrow A$
- An associativity equation  $(ab)c = a(bc)$ .
- Think of  $\mu$  as a 2-linear map. Let  $\circ_1$  and  $\circ_2$  be substitution in the 1st resp. 2nd variable: The associativity becomes

$$\mu \circ_1 \mu = \mu \circ_2 \mu : A \otimes A \otimes A \rightarrow A.$$

$$\mu \circ_1 \mu(a, b, c) = \mu(\mu(a, b), c) = (ab)c$$

$$\mu \circ_2 \mu(a, b, c) = \mu(a, \mu(b, c)) = a(bc)$$

- We get  $n$ -linear functions by iterating  $\mu$ :  
 $a_1 \otimes \cdots \otimes a_n \rightarrow a_1 \cdots a_n.$
- There is a permutation action  $\tau\mu(a, b) = \mu \circ \tau(a, b) = ba$
- This give a permutation action on the iterates of  $\mu$ . It is a free action there and there are  $n!$   $n$ -linear morphisms generated by  $\mu$  and the transposition.

# Feynman categories

## Data

- ①  $\mathcal{V}$  a groupoid
- ②  $\mathcal{F}$  a symmetric monoidal category
- ③  $\iota : \mathcal{V} \rightarrow \mathcal{F}$  a functor.

## Notation

$\mathcal{V}^{\otimes}$  the free symmetric category on  $\mathcal{V}$  (words in  $\mathcal{V}$ ).

$$\begin{array}{ccc}
 \mathcal{V} & \xrightarrow{\iota} & \mathcal{F} \\
 \searrow j & & \nearrow \iota^{\otimes} \\
 & \mathcal{V}^{\otimes} &
 \end{array}$$

# Feynman category

## Definition

Such a triple  $\mathfrak{F} = (\mathcal{V}, \mathcal{F}, \iota)$  is called a Feynman category if

- i  $\iota^{\otimes}$  induces an equivalence of symmetric monoidal categories between  $\mathcal{V}^{\otimes}$  and  $Iso(\mathcal{F})$ .
- ii  $\iota$  and  $\iota^{\otimes}$  induce an equivalence of symmetric monoidal categories  $Iso(\mathcal{F} \downarrow \mathcal{V})^{\otimes}$  and  $Iso(\mathcal{F} \downarrow \mathcal{F})$ .
- iii For any  $* \in \mathcal{V}$ ,  $(\mathcal{F} \downarrow *)$  is essentially small.

# Hereditary condition (ii)

- ① In particular, fix  $\phi : X \rightarrow X'$  and fix  $X' \simeq \bigotimes_{v \in I} \iota(*_v)$ : there are  $X_v \in \mathcal{F}$ , and  $\phi_v \in \text{Hom}(X_v, *_v)$  s.t. the following diagram commutes.

$$\begin{array}{ccc}
 X & \xrightarrow{\phi} & X' \\
 \simeq \downarrow & & \downarrow \simeq \\
 \bigotimes_{v \in I} X_v & \xrightarrow{\bigotimes_{v \in I} \phi_v} & \bigotimes_{v \in I} \iota(*_v)
 \end{array} \tag{1}$$

- ② For any two such decompositions  $\bigotimes_{v \in I} \phi_v$  and  $\bigotimes_{v' \in I'} \phi'_{v'}$  there is a bijection  $\psi : I \rightarrow I'$  and isomorphisms  $\sigma_v : X_v \rightarrow X'_{\psi(v)}$  s.t.  $P_\psi^{-1} \circ \bigotimes_v \sigma_v \circ \bigotimes_v \phi_v = \bigotimes_{v'} \phi'_{v'}$  where  $P_\psi$  is the permutation corresponding to  $\psi$ .
- ③ These are the only isomorphisms between morphisms.

## Hereditary condition (ii)

- ① In particular, fix  $\phi : X \rightarrow X'$  and fix  $X' \simeq \bigotimes_{v \in I} \iota(*_v)$ : there are  $X_v \in \mathcal{F}$ , and  $\phi_v \in \text{Hom}(X_v, *_v)$  s.t. the following diagram commutes.

$$\begin{array}{ccc}
 X & \xrightarrow{\phi} & X' \\
 \simeq \downarrow & & \downarrow \simeq \\
 \bigotimes_{v \in I} X_v & \xrightarrow{\bigotimes_{v \in I} \phi_v} & \bigotimes_{v \in I} \iota(*_v)
 \end{array} \tag{1}$$

- ② For any two such decompositions  $\bigotimes_{v \in I} \phi_v$  and  $\bigotimes_{v' \in I'} \phi'_{v'}$  there is a bijection  $\psi : I \rightarrow I'$  and isomorphisms  $\sigma_v : X_v \rightarrow X'_{\psi(v)}$  s.t.  $P_\psi^{-1} \circ \bigotimes_v \sigma_v \circ \bigotimes_v \phi_v = \bigotimes_{v'} \phi'_{v'}$  where  $P_\psi$  is the permutation corresponding to  $\psi$ .
- ③ These are the only isomorphisms between morphisms.

## Hereditary condition (ii)

- 1 In particular, fix  $\phi : X \rightarrow X'$  and fix  $X' \simeq \bigotimes_{v \in I} \iota(*_v)$ : there are  $X_v \in \mathcal{F}$ , and  $\phi_v \in \text{Hom}(X_v, *_v)$  s.t. the following diagram commutes.

$$\begin{array}{ccc}
 X & \xrightarrow{\phi} & X' \\
 \simeq \downarrow & & \downarrow \simeq \\
 \bigotimes_{v \in I} X_v & \xrightarrow{\bigotimes_{v \in I} \phi_v} & \bigotimes_{v \in I} \iota(*_v)
 \end{array} \tag{1}$$

- 2 For any two such decompositions  $\bigotimes_{v \in I} \phi_v$  and  $\bigotimes_{v' \in I'} \phi'_{v'}$  there is a bijection  $\psi : I \rightarrow I'$  and isomorphisms  $\sigma_v : X_v \rightarrow X'_{\psi(v)}$  s.t.  $P_\psi^{-1} \circ \bigotimes_v \sigma_v \circ \bigotimes_v \phi_v = \bigotimes_{v'} \phi'_{v'}$  where  $P_\psi$  is the permutation corresponding to  $\psi$ .
- 3 These are the only isomorphisms between morphisms.

# Example 1

$$\mathcal{F} = \text{Sur}, \mathcal{V} = \mathbb{I}$$

- $\text{Sur}$  be the category of finite sets and surjection with  $\mathbb{I}$  as monoidal structure
- $\mathbb{I}$  be the trivial category with one object  $*$  and one morphism  $id_*$ .
- $\mathbb{I}^{\otimes}$  is equivalent to the category with objects  $\bar{n} \in \mathbb{N}_0$  and  $\text{Hom}(\bar{n}, \bar{n}) \simeq \mathbb{S}_n$ , where we think  $\bar{n} = \{1, \dots, n\} = \{1\} \amalg \dots \amalg \{1\}$ ,  $1 = \iota(*)$ .
- $\mathbb{I}^{\otimes} \simeq \text{Iso}(\text{Sur})$ .

# Example 1

$$\mathcal{F} = \text{Sur}, \mathcal{V} = \mathbb{I}$$

- $\text{Sur}$  be the category of finite sets and surjection with  $\mathbb{I}$  as monoidal structure
- $\mathbb{I}$  be the trivial category with one object  $*$  and one morphism  $id_*$ .

 \end{array}$$

# *Ops* and *Mods*

## Definition

Fix a symmetric monoidal category  $\mathcal{C}$  and  $\mathfrak{F} = (\mathcal{V}, \mathcal{F}, \iota)$  a Feynman category.

- Consider the category of strong symmetric monoidal functors  $\mathcal{F}\text{-Ops}_{\mathcal{C}} := \text{Fun}_{\otimes}(\mathcal{F}, \mathcal{C})$  which we will call  $\mathcal{F}$ -ops in  $\mathcal{C}$
- $\mathcal{V}\text{-Mods}_{\mathcal{C}} := \text{Fun}(\mathcal{V}, \mathcal{C})$  will be called  $\mathcal{V}$ -modules in  $\mathcal{C}$  with elements being called a  $\mathcal{V}$ -mod in  $\mathcal{C}$ .

## Theorem

The forgetful functor  $G : \mathcal{O}ps \rightarrow \mathcal{M}ods$  has a right adjoint  $F$  (free functor) and this adjunction is monadic.

# Other versions

## Enriched version

We can consider Feynman categories and target categories enriched over another monoidal category, such as  $\mathcal{T}op$ ,  $Ab$  or  $dg\mathcal{V}ect$ .

## Theorem

*The category of Feynman categories with trivial  $\mathcal{V}$  enriched over  $\mathcal{E}$  is equivalent to the category of operads (with the only iso in  $\mathcal{O}(1)$  being the identity) in  $\mathcal{E}$  with the correspondence given by  $\mathcal{O}(n) := Hom(\bar{n}, \bar{1})$ . The  $\mathcal{O}ps$  are now algebras over the underlying operad.*

# Examples of this simple structure

## Examples

Operad of surjections (corollas), non-symmetric version ordered surjections (planar corollas), simplices (Joyal dual). Operad of leaf labelled rooted trees (gluing at leaves), non-symmetric version planar rooted trees.

## More

Other examples are twisted modular operads, non-sigma versions, the simplicial category, crossed simplicial groups, FI-algebras.

# More constructions $+$ -construction

## In general

there is a " $+$ " construction, like for polynomial monads, that produces a new Feynman category out of an old one.

The main theorem is that enrichments of  $\mathcal{F}$  are basically in 1-1 correspondence with  $\mathcal{F}^+$ -Ops.

## Examples

$\mathcal{F}_{\text{modular}}^+ = \mathcal{F}_{\text{hyper}}$  and twisted modular operads as algebras over the twisted triple.  $\mathcal{F}_{\text{surj}}^+ = \mathcal{F}_{\text{operads}}$ ,  $\mathcal{F}_{\text{monoid}}^+ = \mathcal{F}_{\text{surj}}$ . (Slightly more complicated)

## Algebras

The  $\mathcal{F}^+$ -Ops then give enrichments for  $\mathcal{F}$  and given such an  $\mathcal{O} \in \mathcal{F}^+$ -Ops the  $\mathcal{F}_{\mathcal{O}}$ -Ops are (by definition) algebras over  $\mathcal{O}$ .

# More constructions: $\mathcal{F}_{dec\mathcal{O}}$ joint w/ Jason Lucas

## In general

Given an  $\mathcal{O} \in \mathcal{F}\text{-Ops}$ , then there is a Feynman category  $\mathcal{F}_{dec\mathcal{O}}$  which is indexed over  $\mathcal{F}$ . Its objects are pairs  $(X, dec \in \mathcal{O}(X))$  and  $Hom_{\mathcal{F}_{dec\mathcal{O}}}((X, dec), (X', dec'))$  is the set of  $\phi : X \rightarrow X'$ , s.t.  $\mathcal{O}(\phi) : dec \rightarrow dec'$ .

## Examples

Non-sigma operads, cyclic non-Sigma operads, non-Sigma modular operads.

Here  $\mathcal{O}$  is *Assoc*, *CyAssoc*, *ModCycAssoc*.

There is a general theorem saying that the decoration by the push-forward exists and how such push-forwards factor. This recovers e.g. that the modular envelope of *CyAssoc* factors through non-Sigma modular operads (Result of Markl).

# More $\mathcal{F}_{dec}$

## Further applications

Further applications will be

- ① the Westerland–Wahl  $A_\infty$  moduli space operations generalizing those of R.K. . *Moduli space actions on Hochschild Cochains*
- ② The Stolz–Teichner setup for twisted field theories.
- ③ Kontsevich's graph complexes.

## Example 2

### The Borisov-Manin category of graphs.

- 1 A graph  $\Gamma$  is a tuple  $(F, V, \partial, \iota)$  of flags  $F$ , vertices  $V$ , incidence  $\partial : F \rightarrow V$  and flag gluing  $\iota : F^{\circlearrowleft}$ .  $\iota^2 = id$ . We either glue two half-edges or keep a tail.
- 2 A graph morphism  $\phi : \Gamma \rightarrow \Gamma'$  is a triple  $(\phi_V, \phi^F, \iota_\phi)$ , where  $\phi_V : V \rightarrow V'$  is a surjection on vertices,  $\phi^F : F' \rightarrow F$  is an injection and  $\iota_\phi : F \setminus \phi^F(F')^{\circlearrowleft}$  a pairing (ghost edges).
- 3 A graph morphism from a collection of corollas  $\Gamma$  to a corolla  $*$  has a ghost graph  $\Pi = (V_\Gamma, F_\Gamma, \iota_\phi)$

$$\mathfrak{F} = (\mathit{Agg}, \mathit{Crl}, \iota)$$

*Agg* the full subcategory whose objects are aggregates of corollas.

*Crl* the category of corollas with isomorphisms.

# Examples

Roughly (in the connected case and up to isomorphism)

The source of a morphism are the vertices of the ghost graph  $\Pi$  and the target is the vertex obtained from  $\Pi$  obtained by contracting all edges. If  $\Pi$  is not connected, one also needs to merge vertices according to  $\phi_V$ .

Composition corresponds to insertion of ghost graphs into vertices.

$$\begin{array}{c}
 X \xrightarrow{\phi_2} Y \xrightarrow{\phi_1} * \\
 \searrow \quad \nearrow \\
 \phi_0
 \end{array}$$

up to isomorphisms (if  $\Pi_0, \Pi_1$  are connected) corresponds to inserting  $\Pi_V$  into  $*_V$  of  $\Pi_1$  to obtain  $\Pi_0$ .

$$\begin{array}{c}
 \Pi_V \Pi_{w \in V_V} *_w \xrightarrow{\Pi_V \Pi_V} \Pi_V *_V \xrightarrow{\Pi_1} * \\
 \searrow \quad \nearrow \\
 \Pi_0
 \end{array}$$

# Graph Examples

## $\mathcal{O}ps$

We can restrict the underlying ghost graphs of maps to corollas to obtain several Feynman categories. The  $\mathcal{O}ps$  will then yield types of operads or operad like objects.

## Types of operads and graphs

$\mathcal{O}ps$	Graphs
Operads	rooted trees
Cyclic operads	trees
Modular operads	connected graphs (add genus marking)
PROPs	directed graphs (and input output marking)
NC modular operad	graphs (and genus marking)
Broadhurst-Connes	1-PI graphs
-Kreimer	
...	...

# Physics connection

## Feynman graphs

are the morphisms in the Feynman category. The possible vertices are the objects.

## $S$ -matrix

The external lines are given by the target of the morphism. The comma/slice category over a given target is then a graphical version of the  $S$ -matrix.

## Correlation functions

These are given by the functors  $\mathcal{O}$ .

## Open Questions

What corresponds to algebras and plus construction, functors. Possible answers via Rota–Baxter (in progress).

# Universal constructions: What we can do:

- 1 Push-forwards and pull-backs along functors between Feynman categories.

THINK INDUCTION/RESTRICTION/EXTENSION BY 0.

- 2 Co(bar) transforms and resolutions. Think (co)bar transformation/resolution for algebras as well as Feynman transforms and master equations.

NB: THIS NEEDS MODEL CATEGORY THEORY WHICH WE PROVIDE

- 3 Universal operations. Lie-brackets, BV etc.
- 4 Hopf algebra structures (joint with I. Gálvez-Carrillo and A. Tonks).

*This includes Connes-Kreimers Renormalization Hopf algebra, Goncharov's Hopf algebra for multi-zetas (polylogs) and Baues' double cobar Hopf algebra.*

# Hopf algebras

## Basic structures

Assume  $\mathcal{F}$  is decomposition finite. Consider

$\mathcal{B} = \text{Hom}(\text{Mor}(\mathcal{F}), \mathbb{Z})$ . Let  $\mu$  be the tensor product with unit  $id_{\mathbb{1}}$ .

$$\Delta(\phi) = \sum_{(\phi_0, \phi_1): \phi = \phi_1 \circ \phi_0} \phi_0 \otimes \phi_1$$

and  $\epsilon(\phi) = 1$  if  $\phi = id_X$  and 0 else.

## Theorem (Galvez-Carrillo, K , Tonks)

*$\mathcal{B}$  together with the structures above is a bi-algebra. Under certain mild assumptions, a canonical quotient is a Hopf algebra*

## Examples

In this fashion, we can reproduce Connes–Kreimer’s Hopf algebra, the Hopf algebras of Goncharov and a Hopf algebra of Baues that he defined for double loop spaces. This is a non-commutative graded version. There is a three-fold hierarchy. A non-commutative version, a commutative version and an “amputated” version.

# Details I

## Non-commutative version

Use Feynman categories whose underlying tensor structure is only monoidal (not symmetric).  $\mathcal{V}^{\otimes}$  is the the free monoidal category.

## Key Lemma

The bi-algebra equation holds due to the hereditary condition.

## Unit

The unit of the co-algebra is given by  $1 = id_{\emptyset}$ , i.e. the identity morphism of the empty word.

## Quotient by Isomorphisms

If there are any isomorphism in  $\mathcal{V}$  then  $\mathcal{F}$  one can quotient out the co-ideal defined by equiv. rel. generated by isomorphism diagrams of type (1). The result is called almost connected. (This is automatic if there are no isomorphism except for identities in  $\mathcal{V}$ ).

## Details II

### Theorem

For the almost connected version let  $\mathcal{I}$  be the ideal generated by  $1 - id_X$ . Then this is a co-ideal and the quotient  $\mathcal{B}/\mathcal{I}$  is a connected Hopf algebra and hence a bi-algebra. Goncharov and Baues (shifted co-bar version), planar Connes-Kreimer with external lines (both tree and 1-PI).

### Commutative version

For the commutative version, one looks at the co-invariants in the symmetric case. Non-planar Connes-Kreimer with external lines.

### Amputated version

For this one needs a semi-cosimplicial structure, i.e. one must be able to forget external legs coherently. Then there is a colimit, in which all the external legs can be forgotten. Connes-Kreimer without external legs (e.g. the original tree version).

## Details III

### Generalization: co-operad with multiplication

In a sense the above examples were free. One can look at a more general setting where this is not the case. The length of an object is replaced by a depth filtration. The algebras are then deformations of their associated graded. Main example (cooperad with multiplication) generalizes enrichment of  $F_{surj}$ .

### Grading/Filtration

Co-operad with multiplication	operad degree – depth
Amputated version	co-radical degree + depth

### $q$ deformation - infinitesimal version

Taking a slightly different quotient, one can get a non-unital, co-unital bi-algebra and a  $q$ -filtration. Sending  $q \rightarrow 1$  recovers  $\mathcal{H}$ .

# Universal operations

## Cocompletion

Let  $\hat{\mathcal{F}}$  be the cocompletion of  $\mathcal{F}$ . This is monoidal with Day convolution  $\otimes$ . If  $\mathcal{C}$  is cocomplete, and  $\mathcal{O} \in \text{Ops}$  factors.

$$\begin{array}{ccc}
 \mathcal{F} & \xrightarrow{\mathcal{O}} & \mathcal{C} \\
 & \searrow \mathcal{J} & \nearrow \hat{\mathcal{O}} \\
 & \hat{\mathcal{F}} &
 \end{array}$$

## Theorem

Let  $\mathbb{I} := \text{colim}_{\mathcal{V}} \mathcal{J} \circ \mathcal{I} \in \hat{\mathcal{F}}$  and let  $\mathcal{F}_{\mathcal{V}}$  the symmetric monoidal subcategory generated by  $\mathbb{I}$ . Then  $\mathfrak{F}_{\mathcal{V}} := (\mathcal{F}_{\mathcal{V}}, \mathbb{I}, \nu_{\mathcal{V}})$  is a Feynman category. (This gives an underlying operad of universal operations).

# Examples

## Operads

$\mathfrak{D}$  the Feynman category for operads,  $\mathcal{C} = dgVect$ .

- Then  $\hat{\mathcal{O}}(\mathbb{I}) = \bigoplus_n \mathcal{O}(n)_{\mathfrak{S}_n}$  and the Feynman category is (weakly) generated by  $\circ := [\sum \circ_i]$ . (This is a two line calculation).
- This gives rise to the Lie bracket by using the anti-commutator. The operations go back to Gerstenhaber and Kapranov-Manin.
- It lifts to the non-Sigma case i.e. a pre-Lie structure on  $\bigoplus_n \mathcal{O}(n)_{\mathfrak{S}_n}$ .

# Examples

## Operads

$\mathfrak{D}$  the Feynman category for operads,  $\mathcal{C} = dgVect$ .

- Then  $\hat{\mathcal{O}}(\mathbb{I}) = \bigoplus_n \mathcal{O}(n)_{\mathfrak{S}_n}$  and the Feynman category is (weakly) generated by  $\circ := [\sum \circ_i]$ . (This is a two line calculation).
- This gives rise to the Lie bracket by using the anti-commutator. The operations go back to Gerstenhaber and Kapranov-Manin.
- It lifts to the non-Sigma case i.e. a pre-Lie structure on  $\bigoplus_n \mathcal{O}(n)_{\mathfrak{S}_n}$ .

# Examples

## Operads

$\mathfrak{D}$  the Feynman category for operads,  $\mathcal{C} = dgVect$ .

- Then  $\hat{\mathcal{O}}(\mathbb{I}) = \bigoplus_n \mathcal{O}(n)_{\mathbb{S}_n}$  and the Feynman category is (weakly) generated by  $\circ := [\sum \circ_i]$ . (This is a two line calculation).
- This gives rise to the Lie bracket by using the anti-commutator. The operations go back to Gerstenhaber and Kapranov-Manin.
- It lifts to the non-Sigma case i.e. a pre-Lie structure on  $\bigoplus_n \mathcal{O}(n)_{\mathbb{S}_n}$ .

# Universal Operations

$\mathfrak{F}$	Feynman category for	$\mathfrak{F}, \mathfrak{F}_\nu, \mathfrak{F}_\nu^{nt}$	weakly gen. subcat.
$\mathfrak{D}$	Operads	rooted trees	$\widetilde{\mathfrak{F}}_{pre-Lie}$
$\mathfrak{D}^{odd}$	odd operads	rooted trees + orientation of set of edges	odd pre-Lie
$\mathfrak{D}^{pl}$	non-Sigma operads	planar rooted trees	all $\circ_i$ operations
$\mathfrak{D}_{mult}$	Operads with mult.	b/w rooted trees	pre-Lie + mult.
$\mathfrak{C}$	cyclic operads	trees	commutative mult.
$\mathfrak{C}^{odd}$	odd cyclic operads	trees + orientation of set of edges	odd Lie
$\mathfrak{M}^{odd}$	$\mathfrak{K}$ -modular	connected + orientation on set of edges	odd dg Lie
$\mathfrak{M}^{nc, odd}$	nc $\mathfrak{K}$ -modular	orientation on set of edges	BV

**Table:** Here  $\mathfrak{F}_\nu$  and  $\mathfrak{F}_\nu^{nt}$  are given as  $\mathcal{F}_\mathcal{O}$  for the insertion operad. The former for the type of graph with unlabelled tails and the latter for the version with no tails.

# Examples

## Odd/anti-cyclic Operad

The universal operations are (weakly) generated by a Lie bracket.  $[\cdot, \cdot] := [\sum_{st} \circ_{st}]$ , (see [KWZ]). This actually lifts to cyclic coinvariants (non-sigma cyclic operads).

Specific examples:

- $End(V)$  for a symplectic vector space is anti-cyclic.
- Any tensor product:  $\mathcal{O} \otimes \mathcal{P}(n) := (\mathcal{O}(n) \otimes \mathcal{P})(n)$  with  $\mathcal{O}$  cyclic and  $\mathcal{P}$  anti-cyclic is anti-cyclic.

## Three geometries (Kotsevich, Conant-Vogtmann)

Fix  $V^n$   $n$ -dim symplectic  $V^n \rightarrow V^{n+1}$ . For each  $n$  get Lie algebras

(1)  $Comm \otimes End(V^n)$  (2)  $Lie \otimes End(V^n)$  (3)  $Assoc \otimes End(V^n)$

Take the limit as  $n \rightarrow \infty$ .

# Odd versions

## Odd versions

Given a well-behaved presentation of a Feynman category (generators+relations for the morphisms) we can define an odd version which is enriched over  $\mathcal{A}b$ .

## Odd Feynman categories over graphs

In the case of underlying graphs for morphisms, odd usually means that edges get degree 1, that is we use a Koszul sign with that degree.

# (Co)Bar Feynman transform

## Algebra case

- $C$  associative co-algebra.  $\Omega C := \text{Free}_{alg}(\Sigma^{-1}\bar{C}) +$  differential coming from co-algebra structure
- $A$  associative algebra.  $BA = T\Sigma^{-1}\bar{A} +$  co-differential from algebra structure
- $\Omega BA$  is a free resolution.
- $A$  say finite dim or graded with finite dim pieces  $\check{A}$  its dual.  $FA := \Omega\check{A} +$  differential from multiplication.  $FFA$  a resolution.

We can define the same transformation for elements of  $\mathcal{O}ps$  for well-presented Feynman categories

- The result of a Feynman transform is an  $op$  over the odd version of the Feynman category
- For the freeness we need model structures, which we give.

# Master equations

The Feynman transform is quasi-free. An algebra over  $F\mathcal{O}$  is dg-if and only if it satisfies the following master equation.

Name of $\mathcal{F}\text{-}\mathcal{O}ps_{\mathcal{C}}$	Algebraic Structure of $F\mathcal{O}$	Master Equation (ME)
operad [?]	odd pre-Lie	$d(-) + - \circ - = 0$
cyclic operad [?]	odd Lie	$d(-) + \frac{1}{2}[-, -] = 0$
modular operad [?]	odd Lie + $\Delta$	$d(-) + \frac{1}{2}[-, -] + \Delta(-) = 0$
properad [?]	odd pre-Lie	$d(-) + - \circ - = 0$
wheeled properad [?]	odd pre-Lie + $\Delta$	$d(-) + - \circ - + \Delta(-) = 0$
wheeled prop [?]	dgBV	$d(-) + \frac{1}{2}[-, -] + \Delta(-) = 0$

# Geometry and moduli spaces

## Modular Operads

The typical topological examples are  $\bar{M}_{gn}$ . These give rise to chain and homology operads.

- Gromov–Witten invariants make  $H^*(V)$  an algebra over  $H_*(\bar{M}_{g,n})$

## Odd Modular

The canonical geometry is given by  $\bar{M}^{KSV}$  which are real blowups of  $\bar{M}_{gn}$  along the boundary divisors.

- We get 1-parameter gluings parameterized by  $S^1$ . Taking the full  $S^1$  family on chains or homology gives us the structure of an odd modular operad.
- Going back to Sen and Zwiebach, a viable string field theory action  $S$  is a solution of the quantum master equation.

# Next steps

- Formalize the dual pictures of primitive elements and  $+$  construction as well as universal operations and PBW.
- Connect to Tannakian categories. E.g. find out the role of fibre functors or special large/small object. (Idea: special properties of  $\mathcal{H}_{CK}$ ).
- Connect to Rota–Baxter, Dynkin-operators,  $B^+$ -operators (we can do this part) etc.
- Construct Feynman category for the open/closed version of Homological Mirror symmetry.
- Find action of Grothendieck–Teichmüller group (GT).
- ...

# The end

Thank you!
