## The Monotonicity Theorem

Let  $f : (a, b) \rightarrow \mathcal{R}$  be a definable function. Then there are points  $a = a_0 < a_1 < \dots < a_k < a_{k+1} = b$  such that on each subinterval  $(a_j, a_{j+1})$ , either  $f$  is constant or  $f$  is strictly monotone and continuous.

[Introduction](#)[Monotonicity  
Theorem](#)[Cell  
Decomposition](#)[Curve Selection](#)[Connectedness](#)[Ordered Groups](#)[References](#)

## The Monotonicity Theorem

Let  $f : (a, b) \rightarrow \mathcal{R}$  be a definable function. Then there are points  $a = a_0 < a_1 < \dots < a_k < a_{k+1} = b$  such that on each subinterval  $(a_j, a_{j+1})$ , either  $f$  is constant or  $f$  is strictly monotone and continuous.

## Outline of Proof.

The proof follows from three claims:

1. There is a subinterval of  $I$  on which  $f$  is constant or injective.
2. If  $f$  is injective, then  $f$  is strictly monotone on a subinterval of  $I$ .
3. if  $f$  is strictly monotone, then  $f$  is continuous on a subinterval of  $I$ .

Start with a cell decomposition  $\mathcal{C}$  of  $\mathcal{R}^n$  adapted to  $A$

1. For cells of  $\mathcal{C}$ , define  $C \prec D$  if  $C \cap \overline{D} \neq \emptyset$
2.  $C \prec D \Rightarrow \exists$  a path between  $c \in C$  and  $d \in D$
3. Define  $C \sim D$  ( $C, D \subset A$ ) if  $\exists$  a chain  $C = C_0 \prec C_1 \succ C_2 \prec \dots \succ C_l = D$

## Theorem

Let  $A \subset \mathcal{R}^n$  be definable. Then we may write  $A = A_1 \sqcup \dots \sqcup A_k$  (with  $A_i \cap A_j = \emptyset$  for  $i \neq j$ ), where each  $A_i$  is nonempty, open and closed in  $A$ , and definably path connected. Furthermore, this partition is unique.

## Proof (existence).

Start with a cell decomposition  $\mathcal{C}$  of  $\mathcal{R}^n$  adapted to  $A$

1. For cells of  $\mathcal{C}$ , define  $C \prec D$  if  $C \cap \overline{D} \neq \emptyset$
2.  $C \prec D \Rightarrow \exists$  a path between  $c \in C$  and  $d \in D$
3. Define  $C \sim D$  ( $C, D \subset A$ ) if  $\exists$  a chain  $C = C_0 \prec C_1 \succ C_2 \prec \dots \succ C_l = D$
4. Build  $A_i$ s from equivalence classes of  $\sim$

## Theorem

Let  $A \subset \mathcal{R}^n$  be definable. Then we may write  $A = A_1 \sqcup \dots \sqcup A_k$  (with  $A_i \cap A_j = \emptyset$  for  $i \neq j$ ), where each  $A_i$  is nonempty, open and closed in  $A$ , and definably path connected. Furthermore, this partition is unique.

## Corollary

A definably connected definable set is definably path connected.

## Theorem

Let  $A \subset \mathcal{R}^n$  be definable. Then we may write  $A = A_1 \sqcup \dots \sqcup A_k$  (with  $A_i \cap A_j = \emptyset$  for  $i \neq j$ ), where each  $A_i$  is nonempty, open and closed in  $A$ , and definably path connected. Furthermore, this partition is unique.

## Corollary

A definably connected definable set is definably path connected.

When  $\mathcal{R} = \mathbb{R}$ , if  $A$  is definable,  $A$  connected  $\Rightarrow A$  definably connected  $\Leftrightarrow A$  definably path connected  $\Rightarrow A$  path connected.

## Definition

An **ordered group** is a group  $G$  with a linear order  $<$  such that for all  $x, y, z \in G$ ,

$$x < y \Rightarrow zx < zy \text{ and } xz < yz$$
