Erdos-Renyi random graphs G(n, p): vertices = $\{0, 1, \dots, n-1\}$ each pair of vertices has an edge with probability p

A D M A A A M M

- A B M A B M

Erdos-Renyi random graphs G(n, p):

vertices = $\{0, 1, ..., n-1\}$

each pair of vertices has an edge with probability p

Theorem (Fagin, '76)

Let φ be a first-order sentence in the language of graphs. Then $Pr(G(n,p) \models \varphi) \rightarrow 0$ or 1 as $n \rightarrow \infty$.

Erdos-Renyi random graphs G(n, p):

vertices = {0, 1, ..., *n* – 1}

each pair of vertices has an edge with probability p

Theorem (Fagin, '76)

Let φ be a first-order sentence in the language of graphs. Then $Pr(G(n,p) \models \varphi) \rightarrow 0 \text{ or } 1 \text{ as } n \rightarrow \infty$. Furthermore, the probability is 1 iff the random graph $G(\infty,p) \models \varphi$.

Lemma

Over T, every sentence is equivalent to a Boolean combination of:

- "there are m disjoint cycles of size n"
- "there is a chain of length ≥ n"

Theorem

For every sentence φ , φ is true in a 1-generated random structure iff it is true in the 1-generated free structure.

Algebraic varieties and presentations

We consider algebraic varieties in the sense of universal algebra.

A D M A A A M M

Algebraic varieties and presentations

We consider algebraic varieties in the sense of universal algebra.

Definition (Birkhoff, '35)

• A language is *algebraic* if it contains no relation symbols.

Definition (Birkhoff, '35)

- A language is *algebraic* if it contains no relation symbols.
- *algebraic variety*: a class of *L*-structures axiomatized by some sentences of the form $\forall \overline{x} \ t(\overline{x}) = s(\overline{x})$.

Definition (Birkhoff, '35)

- A language is *algebraic* if it contains no relation symbols.
- algebraic variety: a class of *L*-structures axiomatized by some sentences of the form $\forall \overline{x} \ t(\overline{x}) = s(\overline{x})$.
- presentation (ā | r): the "universal" structure where r ≡ u(ā) = v(ā) is satisfied

Definition (Birkhoff, '35)

- A language is *algebraic* if it contains no relation symbols.
- algebraic variety: a class of *L*-structures axiomatized by some sentences of the form $\forall \overline{x} \ t(\overline{x}) = s(\overline{x})$.
- presentation (ā | r): the "universal" structure where r ≡ u(ā) = v(ā) is satisfied
- free structure: $\langle \overline{a} | \varnothing \rangle$

Definition (Birkhoff, '35)

- A language is *algebraic* if it contains no relation symbols.
- algebraic variety: a class of *L*-structures axiomatized by some sentences of the form ∀x̄ t(x̄) = s(x̄).
- presentation (ā | r): the "universal" structure where r ≡ u(ā) = v(ā) is satisfied
- free structure: $\langle \overline{a} | \varnothing \rangle$

Example

Groups and rings are algebraic varieties.

イロン イ理 とくほとく ほ

• $P_{\ell}(\varphi)$ = the probability that $\langle \overline{a} \mid r \rangle \vDash \varphi$ for a randomly chosen r

- A B M A B M

Random presentation

Definition

- $P_{\ell}(\varphi)$ = the probability that $\langle \overline{a} \mid r \rangle \vDash \varphi$ for a randomly chosen r
- a random structure in V satisfies φ if $\lim_{\ell \to \infty} P_{\ell}(\varphi) = 1$.

Example

 $T = {}^{"}f_i, f_j$ commute" and ${}^{"}f_j^{-1}$ is the inverse of f_i ".

A D b 4 A b

Example

 $T = "f_i, f_j$ commute" and " f_i^{-1} is the inverse of f_i ". This variety satisfies the strong 0-1 law.

Example

 $T = "f_i, f_i$ commute" and " f_i^{-1} is the inverse of f_i ".

This variety satisfies the strong 0-1 law.

This corresponds to the variety of *n*-generated abelian groups, which does not satisfy the 0-1 law.

Example

 $T = {}^{"}f_i, f_i \text{ commute" and } {}^{"}f_i^{-1}$ is the inverse of f_i ".

This variety satisfies the strong 0-1 law.

This corresponds to the variety of *n*-generated abelian groups, which does not satisfy the 0-1 law.

Example

 $T = f_i^{-1}$ is the inverse of f_i .

Example

 $T = {}^{"}f_i, f_i \text{ commute" and } {}^{"}f_i^{-1}$ is the inverse of f_i ".

This variety satisfies the strong 0-1 law.

This corresponds to the variety of *n*-generated abelian groups, which does not satisfy the 0-1 law.

Example

 $T = f_i^{-1}$ is the inverse of f_i .

This variety satisfies the strong 0-1 law.

Example

 $T = {}^{"}f_i, f_i \text{ commute" and } {}^{"}f_i^{-1}$ is the inverse of f_i ".

This variety satisfies the strong 0-1 law.

This corresponds to the variety of *n*-generated abelian groups, which does not satisfy the 0-1 law.

Example

 $T = f_i^{-1}$ is the inverse of f_i^{-1} .

This variety satisfies the strong 0-1 law.

This corresponds to the variety of *n*-generated groups.

In general, the 1-generated free structure of a bijective variety is a Cayley graph, and they seem to satisfy the strong 0-1 law.

< 47 ▶

In general, the 1-generated free structure of a bijective variety is a Cayley graph, and they seem to satisfy the strong 0-1 law.

Conjecture/Theorem

If $T \supseteq$ " f_i , f_j commute" and " f_i^{-1} is the inverse of f_i ", then the variety satisfies the strong 0-1 law.

In general, the 1-generated free structure of a bijective variety is a Cayley graph, and they seem to satisfy the strong 0-1 law.

Conjecture/Theorem

If $T \supseteq "f_i, f_j$ commute" and " f_i^{-1} is the inverse of f_i ", then the variety satisfies the strong 0-1 law.

Question

What if we drop commutivity?

Conjecture/Theorem

If there are two elements x_1 and x_2 in the free structure such that a random term equals x_i with a positive probability, then the variety does not satisfy the 0-1 law.

A D M A A A M M

∃ >

Conjecture/Theorem

If there are two elements x_1 and x_2 in the free structure such that a random term equals x_i with a positive probability, then the variety does not satisfy the 0-1 law.

Example

Let
$$T = \{ \forall x \ f^n(x) = x \}.$$

Conjecture/Theorem

If there are two elements x_1 and x_2 in the free structure such that a random term equals x_i with a positive probability, then the variety does not satisfy the 0-1 law.

Example

Let $T = \{ \forall x \ f^n(x) = x \}$. A random structure in this variety is trivial with probability $\phi(n)/n$.
