

## NUMBER THEORY: HOMEWORK 2

DUE WEDNESDAY 6TH SEPTEMBER 2023

- 1.(i) Apply the Euclidean algorithm to determine  $(3992, 2023)$ ;  
(ii) Find integers  $x$  and  $y$  such that  $3992x + 2023y = (3992, 2023)$ ;  
(iii) Find integers  $x, y, z$  such that  $21x + 39y + 91z = 1$ .
2. Find positive integers  $a$  and  $b$  satisfying the equations  $(a, b) = 111$  and  $[a, b] = 999$  simultaneously. Find all solutions.
- 3.(i) We call an integer *squarefree* if it is not divisible by any integer of the form  $a^2$  with  $a > 1$ . Show that every positive integer  $n$  can be written uniquely in the form  $n = ab$  where  $a$  is square-free and  $b$  is square.  
(ii) We call a positive integer  $n$  *squarefull* if, whenever  $p$  is a prime divisor of  $n$ , then  $p^2$  is also a divisor of  $n$ . Show that when  $n$  is squarefull, there exist positive integers  $a$  and  $b$  for which  $n = a^2b^3$ .
- 4.(i) Prove that there are infinitely many prime numbers of the shape  $6k + 5$  for natural numbers  $k$ .  
(ii) Is it possible that all large primes have the shape  $10n \pm 1$ ? More precisely, does there exist a natural number  $p_0$  with the property that whenever  $p$  is a prime number and  $p > p_0$ , then  $p = 10n \pm 1$  for some integer  $n$ ? Justify your answer.

[Hint: Consider carefully Euclid's proof of the infinitude of primes.]

**5\* [Hard].** Let  $1 < a_1 < \dots < a_k < 2n$  be integers *not* dividing each other. Show that  $k \leq n$ . Prove that if  $k = n$  and  $m$  is the integer satisfying  $3^m < 2n < 3^{m+1}$  then  $a_1 \geq 2^m$ .

[Hint: Write each integer  $a_i$  in the form  $(2b + 1)2^c$ . In the second part write  $a_1 = (2m_1 + 1)2^r$  and investigate how many numbers  $a_i$  must be of the form  $(2m_1 + 1)2^c3^d$ .]
