 - Approximation error analysis

Background

Kernel matrix compression

For a kernel function k(x, y) and two well separated sets X and Y, find the low-rank approximation

$$egin{aligned} &\mathcal{K}^{X,Y} := \left(k(x_i,y_j)
ight)_{x_i\in X,y_j\in Y} pprox egin{aligned} &\mathcal{U} & \mathcal{V} \ (m imes n) & \cdot & \mathcal{V} \ (m imes n) & \cdot & \cdot & \cdot \ (r imes n) \end{aligned}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Background

Kernel matrix compression

For a kernel function k(x, y) and two well separated sets X and Y, find the low-rank approximation

$${\mathcal{K}}^{X,Y}_{(m\times n)} := \left(k(x_i, y_j)\right)_{x_i \in X, y_j \in Y} \approx \frac{U}{(m \times r)} \cdot \frac{V}{(r \times n)}$$

Where this problm often appears:

- Numerical solution to PDE/IE
- Cauchy/Toeplitz/Vandermonde systems
- Kernel method in machine learning
- N-body problem

• . . .

.

Background

Kernel matrix compression

For a kernel function k(x, y) and two well separated sets X and Y, find the low-rank approximation

$$\mathcal{K}^{X,Y}_{(m\times n)} := (k(x_i, y_j))_{x_i \in X, y_j \in Y} \approx \bigcup_{(m\times r)} \cdot \bigvee_{(r\times n)}$$

Different compression methods

- Algebraic method
 - Singular value decomposition (SVD)
 - Rank-revealing factorizations: SRRQR [Gu, Eisenstat 96], SRRLU [Miranian, Gu 03], ID [Cheng, et al. 05]...
 - Randomized compression [Frieze, et al. 04][Halko, et al. 11]

The algorithms deal with the matrix purely algebraically regardless of how it is generated.

.

Different compression methods

- Algebraic method
 - Singular value decomposition (SVD)
 - Rank-revealing factorizations: SRRQR [Gu, Eisenstat 96], SRRLU [Miranian, Gu 03], ID [Cheng, et al. 05]...
 - Randomized compression [Frieze, et al. 04][Halko, et al. 11]

The algorithms deal with the matrix purely algebraically regardless of how it is generated.

- Analytical method
 - Multipole expansion [Greengard, Rokhlin 87]
 - Spherical harmonic expansion [Sun, Pitsianis 01]
 - Chebyshev interpolation [Fong, Darve 09]
 - Taylor expansion [Cai, Xia 16]
 - ...

The resulting low-rank approximation usually lacks the structure preserving feature.

To compress the kernel matrix $K^{X,Y}$

< □ > < □ > < □ > < □ > < □ >

To compress the kernel matrix $K^{X,Y}$

SRRQR/ID

$$K^{X,Y} \approx P\begin{pmatrix} I\\ E \end{pmatrix} K^{\tilde{X},Y} := UK^{\tilde{X},Y}$$

U column basis, \tilde{X} representative points.

• = • •

To compress the kernel matrix $K^{X,Y}$

SRRQR/ID

$$K^{X,Y} \approx P\begin{pmatrix} I\\ E \end{pmatrix} K^{\tilde{X},Y} := UK^{\tilde{X},Y}$$

U column basis, \tilde{X} representative points.

Proxy point method

- **2** Compress $K^{X,Z}$ with SRRQR: $K^{X,Z} \approx UK^{\tilde{X},Z}$
- **3** Then $K^{X,Y} \approx UK^{\tilde{X},Y}$

(4) (5) (4) (5)

Appealing features:

Fast and accurate

|Z| can be much smaller than |Y| while still keep very small approximation error.

• Structure preserving Benefits hierarchical matrix techniques.

★ ∃ ► ★

Appealing features:

Fast and accurate

|Z| can be much smaller than |Y| while still keep very small approximation error.

 Structure preserving Benefits hierarchical matrix techniques.

Unanswered questions:

- Why can we use the proxy surface and proxy points? (In some cases, this can be answered by potential theory/Green's identity.)
- Where to pick them? How many?

Model problem

• The kernel function is

$$k(x,y)=rac{1}{(x-y)^d},\quad d\in\mathbb{Z}^+.$$

• Two sets of points satisfy

$$X = \{x_j\}_{j=1}^m \subset \mathcal{D}(0;\gamma_1), \quad Y = \{y_j\}_{j=1}^n \subset \mathcal{A}(0;\gamma_2,\gamma_3).$$

→ Ξ →

Introducing the proxy surface

For an $x \in X$ and $y \in Y$, draw a closed curve Γ between them.

We can show with Cauchy integral theorem:

$$k(x, y) = \frac{1}{2\pi i} \int_{\Gamma} \frac{k(x, z)}{y - z} \mathrm{d}z.$$

Introducing the proxy surface

With a quadrature rule $\{(z_j, \omega_j)\}_{j=1}^N$ on Γ :

$$k(x,y) \approx k_N(x,y) = \frac{1}{2\pi i} \sum_{j=1}^N \omega_j \frac{k(x,z_j)}{y-z_j} = \sum_{j=1}^N k(x,z_j) \frac{\omega_j}{2\pi i (y-z_j)}$$
$$:= \sum_{j=1}^N k(x,z_j) w_N(z_j,y) = K^{x,Z} W_N^{Z,y}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Introducing the proxy surface

With a quadrature rule $\{(z_j, \omega_j)\}_{j=1}^N$ on Γ :

$$:= \sum_{j=1}^N k(x,z_j) w_N(z_j,y) = K^{x,Z} W_N^{Z,y}.$$

Nov. 9, 2018 9/20

Assume $\Gamma = C(0; \gamma)$ is a circle $(|x| < \gamma < |y|)$ and the *N*-point composite trapezoidal rule is used, define

$$\varepsilon_N(x,y) = \left[k_N(x,y) - k(x,y)\right]/k(x,y)$$

(日) (四) (日) (日) (日)

Assume $\Gamma = C(0; \gamma)$ is a circle $(|x| < \gamma < |y|)$ and the *N*-point composite trapezoidal rule is used, define

$$\varepsilon_N(x,y) = \left[k_N(x,y) - k(x,y)\right]/k(x,y)$$

Theorem (approximation error bound)

There exists an $N_1 > 0$ such that for any $N > N_1$, the error is bounded by

$$|\varepsilon_N(x,y)| \leq rac{1}{|y/\gamma|^N - 1} + rac{C}{|\gamma/x|^N - 1}$$

where C is a constant dependent on N, d and |y/x|.

Note: N_1 is independent of γ .

Assume $\Gamma = C(0; \gamma)$ is a circle $(|x| < \gamma < |y|)$ and the *N*-point composite trapezoidal rule is used, define

$$\varepsilon_N(x,y) = \left[k_N(x,y) - k(x,y)\right] / k(x,y)$$

Theorem (optimal γ)

If the error bound is viewed as a real function in γ on the interval (|x|, |y|), then there exists $N_2 > 0$ such that if $N > N_2$,

- ${\small I}{\small I}$ the function has a unique minimizer $\gamma^*,$
- 2 the minimum decays as $\mathcal{O}(|y/x|^{-N/2})$.

Note: γ^* is dependent on *N*, *d* and |y/x|.

< □ > < 同 > < 回 > < 回 > < 回 >

Now for a block

$$\mathcal{K}^{X,Y} \approx \mathcal{K}_N^{X,Y} = \mathcal{K}^{X,Z} \mathcal{W}_N^{Z,Y},$$

note that all entry-wise results still hold if |x| and |y| are replaced by γ_1 and $\gamma_2.$

• • • • • • • • • • • •

Now for a block

$$K^{X,Y} \approx K_N^{X,Y} = K^{X,Z} W_N^{Z,Y},$$

note that all entry-wise results still hold if |x| and |y| are replaced by γ_1 and $\gamma_2.$

Corollary (block error bound)

With $\gamma \in (\gamma_1, \gamma_2)$, the F-norm relative approximation error is bounded by

$$\frac{\|K_N^{X,Y} - K^{X,Y}\|_F}{\|K^{X,Y}\|_F} \leq \frac{1}{(\gamma_2/\gamma)^N - 1} + \frac{C}{(\gamma/\gamma_1)^N - 1}$$

where C is as defined as before with |y/x| replaced by γ_2/γ_1 .

Similarly there exists an optimal γ^* .

Case 1: d = 1

In this case, the kernel function is k(x, y) = 1/(x - y) which is associated with Toeplitz and Cauchy-like matrices.

Proposition

When d = 1, for any N > 0 and $\gamma \in (\gamma_1, \gamma_2)$, the approximation error is bounded by

$$\frac{\|K_N^{X,Y}-K^{X,Y}\|_F}{\|K^{X,Y}\|_F} \leq \frac{1}{(\gamma/\gamma_1)^N-1} + \frac{1}{(\gamma_2/\gamma)^N-1}.$$

If viewed as a function in γ , this upper bound has a unique minimizer $\gamma^* = \sqrt{\gamma_1 \gamma_2}$ and the optimal upper bound is $2/((\gamma_2/\gamma_1)^{N/2} - 1)$.

< □ > < □ > < □ > < □ > < □ > < □ >

Case 1: d = 1

A simple numerical test: m = 200, n = 300, $\gamma_1 = 0.5$, $\gamma_2 = 2$ and $\gamma_3 = 5$, pick X and Y uniformly from their corresponding regions.

Case 1: d = 1

A simple numerical test: m = 200, n = 300, $\gamma_1 = 0.5$, $\gamma_2 = 2$ and $\gamma_3 = 5$, pick X and Y uniformly from their corresponding regions.

• Nothing explicit can be obtained in this case.

< □ > < □ > < □ > < □ > < □ >

- Nothing explicit can be obtained in this case.
- We can turn to our previous theorems for help:

(日) (四) (日) (日) (日)

- Nothing explicit can be obtained in this case.
- We can turn to our previous theorems for help:
 - γ^* and the optimal bound are only dependent on N, d and γ_2/γ_1 .

(日) (四) (日) (日) (日)

- Nothing explicit can be obtained in this case.
- We can turn to our previous theorems for help:
 - γ^* and the optimal bound are only dependent on N, d and γ_2/γ_1 .
 - They are independent of m, n.

Dissect the proxy point method

What we've got so far is an analytical compression method (CI) for a kernel matrix

$$\mathcal{K}^{X,Y} pprox \mathcal{K}^{X,Y}_{\mathcal{N}} = \mathcal{K}^{X,Z} \mathcal{W}^{Z,Y}_{\mathcal{N}}.$$

- Approximation error bounds.
- Optimal choose for γ^* .

Dissect the proxy point method

What we've got so far is an analytical compression method (CI) for a kernel matrix

$$K^{X,Y} \approx K_N^{X,Y} = K^{X,Z} W_N^{Z,Y}.$$

- Approximation error bounds.
- Optimal choose for γ^* .

Proxy point method can be viewed as a hybrid method by combining CI and ID:

$$\begin{split} \mathcal{K}^{X,Y} &\approx \mathcal{K}_{N}^{X,Y} = \mathcal{K}^{X,Z} \mathcal{W}_{N}^{Z,Y} & \text{(by CI on } \mathcal{K}^{X,Y}), \\ &\approx \mathcal{U}\mathcal{K}^{\tilde{X},Z} \mathcal{W}_{N}^{Z,Y} & \text{(by ID on } \mathcal{K}^{X,Z}), \\ &= \mathcal{U}\mathcal{K}_{N}^{\tilde{X},Y} \approx \mathcal{U}\mathcal{K}^{\tilde{X},Y} & \text{(by CI on } \mathcal{K}^{\tilde{X},Y}). \end{split}$$

Approximation error bound

Theorem (error bound)

Xin Ye

The compression error τ_{CI} for the analytical step is the optimal error bound, the relative tolerance (in F-norm) used in ID is τ_{ID} and the constant in SRRQR is f > 1 and the compression rank is r < N. Then a rank-*r* approximation of the kernel matrix $K^{X,Y}$ by the hybrid method satisfies

$$\|K^{X,Y} - UK^{\tilde{X},Y}\|_{F} \leq (C_{\mathsf{CI}}\tau_{\mathsf{CI}} + C_{\mathsf{ID}}\tau_{\mathsf{ID}})\|K^{X,Y}\|_{F}$$

where

$$\begin{split} \mathcal{C}_{\mathsf{CI}} &= 1 + \sqrt{r + (m - r)rf^2} \sqrt{1 - \frac{(m - r)(\gamma_2 - \gamma_1)^{2d}}{m(\gamma_1 + \gamma_3)^{2d}}}, \\ \mathcal{C}_{\mathsf{ID}} &= \frac{\gamma^*(\gamma_1 + \gamma_3)^d}{(\gamma_2 - \gamma^*)(\gamma^* - \gamma_1)^d}. \end{split}$$

Remarks

- The cost of the process is $\mathcal{O}(mNr)$.
- The compression accuracy can be conveniently controlled by this result.
 - In most cases, $\mathcal{C}_{\mathsf{CI}}\sim\mathcal{O}(\sqrt{m})$ and $\mathcal{C}_{\mathsf{ID}}\sim\mathcal{O}(1).$

Remarks

- The cost of the process is $\mathcal{O}(mNr)$.
- The compression accuracy can be conveniently controlled by this result.
 - In most cases, $\mathcal{C}_{\mathsf{CI}}\sim\mathcal{O}(\sqrt{m})$ and $\mathcal{C}_{\mathsf{ID}}\sim\mathcal{O}(1).$
- It explains some heuristics for proxy point method.
 - As long as the set Y is within the annulus region, the approximation error bound is independent of |Y| or where they are.
 - N = |Z| can be very small regardless of |X| and |Y|. By our analysis, it is only dependent on γ_2/γ_1 (separation of two sets).

< □ > < □ > < □ > < □ > < □ > < □ >

Conclusion

Conclusion

- We rigorously justified the use of proxy points via contour integration, presented the corresponding error analysis and discussed how to achieve optimal performance.
- Apply the results to proxy point method understood as a hybrid method, obtained a clear connection between the approximation error and how proxy points are picked.
- This can be applied to hierarchical techniques for certain types of matrices and potentially reduce the construction cost to be below linear.
- We are currently working on similar analysis for other kernels and geometries.
