<i>Preface</i>	v
1. Introduction	1
1.1 Linear partial differential equations	1
1.2 Random walks and the heat equation	2
1.3 Numerical schemes	3
1.4 Examples and applications of the discrete Laplacian . . .	5
1.5 A reader's guide	6
 Part I: Cartesian grids and meshes	 9
2. Finite difference method	11
2.1 Second order finite difference approximations	11
2.2 Dirichlet boundary conditions in one dimension	12
2.2.1 Consistency, stability and convergence	13
2.2.2 Stability by eigenvalues of K	15
2.2.3 An implementation in MATLAB	16
2.2.4 Nonhomogeneous Dirichlet boundary conditions .	17
2.3 Dirichlet and Neumann b.c. in one dimension	18
2.3.1 A symmetric matrix T	18
2.3.2 Nonsymmetric matrix T_2	20
2.4 *Convergence in maximum norm	21
2.4.1 Dirichlet boundary conditions	22
2.4.2 Dirichlet and Neumann b.c.	22
2.4.3 Why the scheme $T_2 U_h = F$ is second order accurate	22
2.5 Neumann boundary conditions in one dimension	23

2.5.1	The matrix B on the one-half grid	23
2.5.2	The matrix B on the integer grid	24
2.5.3	The matrix B_2 on the integer grid	24
2.5.4	Compatibility condition of Neumann b.c.	25
2.5.5	Inverting B	27
2.5.6	Inverting B_2	28
2.6	Periodic boundary conditions in one dimension	29
2.7	Dirichlet boundary conditions in two dimensions	29
2.8	Neumann boundary conditions in two dimensions	33
2.9	Efficient implementations in three dimensions	35
2.10	Higher order accuracy: the 9-point discrete Laplacian	37
2.11	Variable coefficient problems	39
2.11.1	Dirichlet boundary conditions in one dimension	39
2.11.2	Dirichlet boundary conditions in two dimensions	40
2.11.3	Neumann boundary conditions in one dimension	41
3.	Finite element method on rectangular meshes	45
3.1	Motivation and overview	45
3.2	Preliminaries	47
3.2.1	Weak derivatives and Sobolev spaces	47
3.2.2	Interpolation and quadrature	50
3.3	Homogeneous Dirichlet b.c. in one dimension	52
3.3.1	Variational formulation	52
3.3.2	Bilinear form	53
3.3.3	The abstract finite element method	54
3.3.4	The abstract implementation	54
3.3.5	The simple implementation on uniform meshes	55
3.4	Basic properties of the bilinear form	59
3.4.1	Continuity	59
3.4.2	Coercivity	59
3.4.3	Coercivity is stability	60
3.5	Error estimates of the abstract finite element method	61
3.5.1	H^1 -norm estimate and convergence	62
3.5.2	* L^2 -norm estimate	64
3.5.3	Summarization and comparison	66
3.6	Properties of the bilinear form with quadrature	67
3.6.1	Equivalent norms of the piecewise linear polynomial	67
3.6.2	Coercivity and continuity of the bilinear form $\mathcal{A}_h$	68

Contents

ix

3.6.3	Coercivity implies stability of the finite difference scheme	69
3.7	*Error estimates of the finite element method with quadrature	71
3.7.1	First Strang Lemma	71
3.7.2	Quadrature estimate: Bramble-Hilbert Lemma	72
3.7.3	Error estimates	74
3.8	Generalization: general domain in two dimensions	75
3.9	Generalization: purely Neumann b.c.	79
3.9.1	Quotient space $H^1(\Omega)/P^0(\Omega)$	80
3.9.2	Variational formulation and coercivity	81
3.9.3	The finite element method	81
3.9.4	Coercivity implies the stiffness matrix null space	82
3.9.5	The finite difference form	82
3.9.6	How to solve the singular linear system	83
3.9.7	Why symmetry of S is important	85
3.10	Generalization: nonhomogeneous Dirichlet b.c.	85
3.10.1	A scheme in theory	86
3.10.2	A simple and practical scheme	87
3.10.3	A scheme in theory for a general domain Ω	89
3.10.4	A simple and practical scheme in two dimensions	90
3.10.5	The error in the 2-norm over grid point values	91
3.11	Generalization: a general elliptic operator	92
3.12	Generalization: higher order accuracy via P^2	93
3.12.1	Dirichlet b.c.	94
3.12.2	Neumann b.c.	96
3.12.3	The fourth order accuracy of P^2 FEM as a finite difference scheme	97
3.13	Efficient inversion of Laplacian in three dimensions	98
3.14	*Superconvergence	101
3.14.1	The delta function	102
3.14.2	The one-dimensional Green's function	103
3.14.3	Superconvergence at knots in one dimension	103
3.15	Comparison with traditional finite difference method	105
3.15.1	Advantages of the finite element method	105
3.15.2	Limitations of the finite element method	105
4.	Applications and examples on Cartesian grids	107
4.1	Poisson solver in computational fluid dynamics	107

x	<i>Ubiquitous Laplacian: Numerical PDEs with Applications in Data Science</i>
---	---

4.1.1	Navier-Stokes equations in fluid dynamics	108
4.1.2	Why Laplacian is hidden in incompressibility	109
4.1.3	Project: incompressible flows with periodic boundary	110
4.1.4	Project: Lid Driven Cavity flow	113
4.1.5	Project: 3D Cahn-Hilliard in phase field models	117
4.2	Total Variation norm for image processing	121
4.2.1	Continuum ROF image denoising model	121
4.2.2	Discrete ROF model	123
4.2.3	Primal, dual and primal-dual forms	124
4.2.4	Poisson solver in ADMM for the primal problem	127
4.2.5	Poisson solver in DRS on the dual problem	128
4.2.6	Project: ADMM for TV norm minimization	130
4.3	Sobolev gradient flow for Gross-Pitaevskii eigenvalue problem	132
4.3.1	The ground state eigenvalue problem	132
4.3.2	The finite element method with quadrature	133
4.3.3	The matrix-vector form	134
4.3.4	Explicit finite difference formulation	136
4.3.5	Gradient flow methods	137
4.3.6	Project: gradient flows for the ground state	138
4.4	Optimal Transport problems	140
4.4.1	Dynamical formulation	141
4.4.2	The convex formulation	143
4.4.3	ADMM and Poisson solver	146
4.4.4	Project: implement ADMM for optimal transport	147

Part II: Unstructured meshes and point clouds 149

5.	A brief introduction to differential geometry	151
5.1	Defining surfaces and manifolds	152
5.1.1	Definition by level-set representation	152
5.1.2	Definition by coordinate charts	154
5.2	Metrics of a manifold	159
5.3	Integration on manifolds	162
5.4	Differential operators on manifolds	164
5.5	Energy on manifolds	168
5.6	PDEs of interest	170
6.	Laplacian on triangular mesh discretization of surfaces	175

Contents

xi

6.1	Surfaces and triangular mesh representation	176
6.1.1	Barycentric coordinates in a triangle	177
6.1.2	Functions, vector fields, and operators on a triangle	178
6.1.3	Triangular meshes for surfaces	179
6.2	Discrete differential operators on triangular meshes	181
6.2.1	Gradient on a triangular mesh	182
6.2.2	Discrete divergence	182
6.3	A finite element method for Laplacian on surface	183
6.3.1	Nodal basis, linear interpolation, and projection .	183
6.3.2	Stiffness and mass matrices, and discrete Laplacian	184
6.3.3	* Random walk in two dimensions	188
6.4	Numerical PDEs on surfaces	190
6.4.1	Galerkin formulation for a surface Poisson problem	190
6.4.2	Numerical scheme for Poisson equation	191
6.4.3	Heat equation and the eigenvalue problem	193
6.5	*Error estimates of the surface finite element method . . .	194
6.5.1	Projection, lift, and interpolation	194
6.5.2	Error estimates for the mean zero solution	197
7.	Laplacian on point cloud representation of manifolds	201
7.1	Moving least square method for solving PDEs on manifolds represented by point clouds	202
7.1.1	Point cloud representation and local geometry . .	203
7.1.2	Moving least squares approximation of the manifold	205
7.1.3	Local polynomial approximation of functions . . .	207
7.1.4	Discrete differential operators on point clouds . .	209
7.1.5	Solving PDEs on point clouds	211
7.2	Local mesh method	214
7.2.1	Local mesh construction and differential operators	214
7.2.2	Finite element analogue	216
7.2.3	Solving equations on point clouds	217
7.3	Solving PDEs on incomplete-distance data	219
7.3.1	Problem setup and local coordinate reconstruction	219
7.3.2	Operator approximation from local reconstructions	221
7.3.3	Numerical examples	222
8.	Applications of Laplacian on manifold-structured data	227
8.1	Image processing on surfaces	228

xii	<i>Ubiquitous Laplacian: Numerical PDEs with Applications in Data Science</i>	
8.2	Computational optimal transport on manifolds	231
8.3	Shape Analysis	234
8.3.1	Conformal parameterization for Genus-0 surfaces	234
8.3.2	Skeleton extraction from point clouds	237
8.3.3	Nonrigid manifolds registration via LB eigenmaps	238
8.4	Committor problem on point clouds	242
	Appendix A Linear algebra	245
A.1	Eigenvalues and min-max principle	245
A.2	Singular values and SVD	246
A.3	Matrix norms	248
A.4	Normal matrices	249
	Appendix B Iterative methods for solving linear systems	251
B.1	Linear iterative methods	251
B.2	Steepest descent	256
B.3	The conjugate gradient method	261
B.4	The preconditioned conjugate gradient method	265
	Appendix C Splitting methods in convex minimization	269
C.1	Indicator function and closed convex proper functions	269
C.2	Proximal operator and Douglas-Rachford splitting	270
C.3	Convex conjugate and Fenchel duality	272
C.4	Douglas-Rachford splitting, ADMM and their equivalence	274
	<i>Bibliography</i>	281
	<i>Index</i>	289
